

THE COUNTRIES OF THE WORLD.

CHAPTER I.

 E are about to start on a long and distant journey over land and sea. We are as I daresay the world was no better then^ere, before we start, to do what all wise travellers temptation was strong, I confess, and men, being general appearance of the great world times"—yielded to it, though it was many a century before an ung. But first of all—let us out, and gibbeted them to scoffing modern gaze: that is, unless they were gone before us, as was that mythical traveller, physieian, and soldier, Sir John de Mandeville, wently many hundred years ago made a "Iournie to Hierusalem," and brought back with him something better than a scallop-shell in his cap, the sword-cuts of a ^{rich} ~~rich~~ warrior, and the love of a Paynim maiden; for, though in his thirty-five years' wanderings from home he experienced all these, and more, yet amid great credulity he carried home some truth, and strange tales, and wonderful arts from the learned men of the distant East. Now, when Sir John came to any country he did not know much about—and his example is not unworthy of imitation in times not so remote—he merely crossed himself, and inscrib'd on his map these ominous words—"This lande is alle fulle of devills!" and passed on.

Those were the Dark Ages of Literature, Art, and Science—in which a brutal soldiery rode rough-shod over a weary, blood-stained land; and a rapacious priesthood, corrupt and fallen from the high estate of the successors of the Apostles, held in their cruel, greedy grip the purses of men, and strangled, with the withe of superstition and untruth, the soul which liveth after. Yet these are sometimes called by people, to whose fertile

with gifts and letters to other princes afar off. If you were a soldier with a good sword, made in Toledo, on your thigh, and a shirt of mail, forged in Milan (not to say by dwarfs in Lapland or Böhmerland), and a *menu* of stout "horse earles" at your back, armed with haekbnt, and bill, and axe, and helm, or cross-bow and quarrell, or half-hag and culverin, or whatever was the lethal weapon most in favour at the time, it would be hard if, in a day when men were quick to seize and slow to give back again, you could not secure a living for yourself somehow or other.

If the times be changed, so I need not say are the travellers thereof. I fancy, if anybody, soldier or civilian, churchman or layman, were to attempt such pranks nowadays, in a country blessed (or otherwise) with a municipal form of government, he would experience the hospitalities of something else than a monastery and a long-suffering peasantry. It even comes within the bounds of fancy that the mob—ever profane and vulgar, ever prosaic!—would "shy" the usual unkindly "half-briek" at his head, and direct him to the casual ward of the workhouse, where doubtless the beadle would—after the mediæval traveller had wrought out his breakfast in the stoneyard—hustle him on to the next parish; if, indeed, he were not so unfortunate as to be haled before Mr. Justice Shallow, and there and then get three weeks in the county gaol as a confirmed vagrant!

Lastly, some modern travellers cannot but be sensible of how great an advantage it must have been to travel in those days; for if few books were written, and those only in rolls of parchment, stowed away in the libraries of monasteries, there were still fewer critics, and no cynical reviewer to point out with jeer and jest the holes in the traveller's coat. The writer of the "Travels and Adventures" of those days had thus unlimited licence to "shoot with the long-bow" for the term of his natural life, and, as I daresay the world was no better then than it is now, their lies live after them. The temptation was strong, I confess, and men, being only men—even in those "good old times"—yielded to it, though it was many a century before an ungrateful world found them out, and gibbeted them to scoffing modern gaze: that is, unless they were as conscientious as was that mythical traveller, physician, and soldier, Sir John de Mandeville, who so many hundred years ago made a "Journie to Hierusalem," and brought back with him something better than a scallop-shell in his cap, the sword-cuts of a Saracen warrior, and the love of a Paynim maiden; for, though in his thirty-five years' wanderings from home he experienced all these, and more, yet amid great credulity he carried home some truth, and strange tales, and wonderful arts from the learned men of the distant East. Now, when Sir John came to any country he did not know much about—and his example is not unworthy of imitation in times not so remote—he merely crossed himself, and inscribed on his map these ominous words—"This lande is alle fulle of devills!" and passed on.

Those were the Dark Ages of Literature, Art, and Science—in which a brutal soldiery rode rough-shod over a weary, blood-stained land; and a rapacious priesthood, corrupt and fallen from the high estate of the successors of the Apostles, held in their cruel, greedy grip the purses of men, and strangled, with the withe of superstition and untruth, the soul which liveth after. Yet these are sometimes called by people, to whose fertile

imagination "cows afar off have always long horns," the "good old times," though I have always failed to understand that they were good for anybody but the rough, cut-throat scoundrels who rode marauding over the land, and sailed marauding on the seas—for them and for their myrmidons. They were certainly not good for the simple peasant, who was dragged, an unwilling man-at-arms, to follow his liege lord to plunder another baron and his peasants, who had displeased the great man, whose white castle lorded it over all the lauds around; they were certainly not good for the widow and the orphan; for the son who was left to die on a distant battle-field, with wounds unstanch'd and thirst unslaked; for the father, pining in the dungeon of some feudal lord; and the merchant, whose vessels were stopped on the high seas by the gentlemen of those "good old times," certainly

THE EARTH, AS KNOWN TO THE GREEKS IN THE TIME OF HOMER.

entertained but an indifferent opinion regarding the felicities of the age in which he was doomed to live; while the homeless owners of smoking villages and deserted fields, designated, if they dared to speak at all, the mail-clad knights—who look so picturesque on paper and in paintings—and the times which tolerated them, as something quite the antipodes of good.

HOW THE WORLD HAS BEEN DISCOVERED.

It has been already remarked that every nation, when it begins to speculate upon geographical matters, and to form surmises as to the nature of the earth, regards the world as a vast plain, the centre of which is the country to which the speculators themselves belong. The regions which lie beyond appear to "the prismatic hues of imagination" an area which fancy peoples with mythical beings and Utopias. The Greeks of Homer's time knew, from actual observation, no more of the world than the shores of Egypt and Asia Minor; but they filled all the outlying regions with "hydras, gorgons, and chimæras dire;" with happy isles beyond the western sea; with a race of

supremely wise, happy, and long-lived mortals in the hyperborean regions; with isles of the sirens; with Olympus itself, the abode of the gods; and with Elysian fields, a terrestrial paradise of departed heroes. Encircling this world-plain flowed the ocean, from which the sun rose, and into which it set. And with some nations, as the Scandinavians and Hindoos, while their own country formed the centre, with the abode of the gods (Medgard or Mera) forming the highest point, other worlds separated by seas were supposed to lie round in concentric circles—ideal regions, which embodied the dreams

SYMBOLICAL REPRESENTATION OF THE EARTH, ACCORDING TO THE HINDOOS.

and superstitions of the natural mind. "It was an age of dreams, when poets could make of the earth what they pleased; peopling its surface with their fancies, girdling it with ocean rivers or *flammauria mania*, and resting it on the shoulders of a giant, or the back of an elephant." The conquering expeditions of the Romans into the distant interior of continents supplemented the discoveries made by the voyages of the Egyptians Phœnicians, and their colonist offspring, the Carthaginians.

But after all, the world as known to the ancients—the *Orbis Feteribus Notus* of the classical atlases—was very little more than the basin of the Mediterranean, and a portion of the countries bordering it. Not one half of Europe was even known. Its dark forests still were haunted by savage tribes, with whom the legions had never measured their strength; and Asia was only penetrated in the south-western quarter, lying south of a line drawn from the Black Sea to the Indus. The Greeks and Romans could people with

mythological personages the lands lying north of the Tay, in those Britannic Isles which formed the northern limits to the conquests of Rome. Hardly a twelfth of the known world was even imperfectly known to those whom we sometimes assume to be the first of conquerors, and the most polished and intellectual of the sons of men. The Phœnicians, however, bent on commerce, soon extended the boundaries of the then explored world. In Britain they were known as tin traders, and in Africa as purchasers of apes, gold, spices, and fine woods. As early as 600 B.C., there is little doubt but that they circumnavigated the latter continent; and it is probable even that they had bartered Indian perfumes, gold, peacocks, and other wonderful things, for the shekels of the rich Israelitish merchants. Then the Arabians, extending their expeditions into the Eastern seas, were known in the ports of India and Siam, and even in far-off China. The news of their discoveries, however, spread but slowly throughout Europe. Newspapers there were none; books few, and in manuscript; and atlases were not even dreamt of. Accordingly, though Arabia was at that time more closely connected with Europe than now, and ranked much higher in the world, it was not until long after that the Arabs were credited with these voyages, or that the rest of the world benefited much thereby. Meanwhile, the Scandinavians—half merchants, half soldiers, the whole coloured with a deep dash of the pirate—had discovered Iceland, Greenland, and had even, if the Sagas are to be credited, sailed as far as America, and made settlements where now the Yankee town of Taunton stands.

On land, the Mongols from Central Asia, in their mad career of conquest and pillage, had spread terror from the gates of Peking to the frontier of Germany. Russia, China, Bagdad, and Delhi are landmarks in the wide-spread deluge of these bold horsemen, whose conquests, however, left nothing behind them but bloodshed and destruction. The followers of Genghis-Khan and his successors were rude barbarians, who cared nothing for the spread of knowledge and civilisation, and beyond an insane desire for slaughter, and a fanatical zeal for the spread of the religion of the Prophet, they seem to have had no aspirations. Their conquests were not, however, altogether without benefit to geographical knowledge; for one famous European adventurer, the Venetian, Marco Polo, entering the service of China, was enabled to follow the Mongols in their track from the northern corner of the Black Sea, across the Caspian and over the vast plains and mountain ranges of Central Asia on to Peking, and recorded his observations in a work, the value of which time, instead of diminishing, has increased. This was towards the close of the thirteenth century.

Portugal was next to have the honour of great discoveries—discoveries that far eclipsed anything which had gone before, and, we may confidently say, anything which came after them. Those voyages of seamen of the little Iberian kingdom were the commencement of what we may safely designate as a systematic scheme of maritime discovery and exploration—undertaken, no doubt, in the interest of commerce; but commerce is ever the aid and sister of geographical discovery, and the Portuguese navigators were, in most instances, men whose minds could soar above the mere thirst for gold. In 1486, Bartholomew Diaz sailed along the Western African coast, as far as the Cape of Good Hope; but, instead of doubling this promontory, and discovering the route to “the Indies” he was in search of, he returned home, and left to his countryman, Vasco da Gama, the honour of reaching India, and of making the discoveries which soon led to both the African and Southern

Indian coasts being dotted with the commercial establishments of Portugal, some of which exist to this day.

The greatest of all the great discoveries of the Middle Ages was yet to come. In 1492—not merely by chance, but impelled in his belief in the soundness of his reasoning from geographical data—the great Columbus, a native of Genoa, but just then in the service of Spain, set sail from the port of Palos, and steering straight across the Atlantic, struck land on one of the West Indian Islands (Watling's Island, in the Bahamas), and discovered the continent of America, though in reality he died ignorant of the fact, always believing that it was only a part of India that he had come across. The discoveries which followed were unparalleled. In less than forty years Africa was circumnavigated; the New World partially explored, and its coast sailed along from the mouth of the St. Lawrence to Cape Horn, and its western shores as far north as Lower California; two new routes were opened up to India; and, finally, the whole world was circumnavigated. Among the brilliant galaxy of names we can only mention those of Cabot, Pinçon, Amerigo Vespucci (who, through an error, and probably a lie, had the honour of having America named after him), Cabral, Solis, and Magellan, a native of Portugal, though sailing in a Spanish ship, who was the first to reach the Pacific—

“——— the first that ever burst
Into that silent sea.”

His ship was the first to circumnavigate the world.

This was a brilliant era in the history of discovery, which the enlightened enthusiasm of Prince Henry of Portugal had fanned into life. But it was a period of maritime adventure alone. The interior of the great continents which these bold sailors visited was, for the most part, unexplored, except in a few places along the banks of great rivers, up which some of the fearless adventurers had sailed in search of gold and pearls. Africa, for instance, was only looked upon as a disagreeable triangle of land, bordered by feverish marshes, past which it was the interest of the navigator to proceed as quickly and safely as might be. Soon the hardy seamen of the other European nations followed the Spaniards and Portuguese along the route which they had discovered, eager to share in the good things which exaggerated rumour affirmed to lie heaped in such abundance in these far-off lands of the East—in the Indies, in Cathay, and Cipango—China and Japan. Africa still remained as it is at our own day—the waste place in the earth, through the wilds of which only a few tracks have been made here and there. But far different was it with America. Into the heart of that continent the daring adventurers were even more eager to penetrate than they had been to skirt its wooded shores. Even Columbus was seized with the prevailing enthusiasm for inland exploration. It was believed to be a part of India—a name then synonymous with all that was wealthy and marvellous; it was even believed that in the interior—in the high uplands—might be found the Garden of Eden—the site of the long-lost Paradise. El Dorados were in every man's mind; universal enthusiasm prevailed, wild excitement permeated all classes of European society; and if the eagerness to be rich were not sufficient to tempt the adventurous seamen that hung about all the seaports of Europe, the stimulus of religious zeal was called in to aid. The days of the Crusaders were past, but the crusading spirit still remained. If there were no Holy Sepulchre to

rescue from the infidel, there were at least swarming millions of swarthy Indians to be brought within the bosom of Mother Church. Once let a symbol of the Faith be planted in every hamlet of "the Indies," and the good men might be at ease regarding the souls of the "salvages," and expect their reward for the good works done in the flesh, if not in this world in the shape of gold, silver, and pearls, plundered by the warriors in whose train they followed, at least in a world where there was no more fighting—no more marching and counter-marching. In all the annals of the most ruthless of victors, there is nothing to compare with the atrocity of the Spanish conquerors of the new world, some facts in regard to which we have had occasion to touch upon in another work, with which the readers of these pages may perhaps have made acquaintance.* "The Spaniards put out the eyes of the New World," are the words of the lively writer,† on whose facts we have freely drawn in the foregoing pages. "The empires of Peru and Mexico fell—their civilisation disappeared and was forgotten—the very races of the continent have almost died out beneath the cruelty and maladministration of their conquerors. We remember reading an account of the discovery of an ancient Etrurian sepulchre, wherein a figure was seen sitting, attired in the strange regality of a remote past; everything was perfect as life; but no sooner did the discoverers too rashly enter, than the figure and the throne, and stately adjuncts, suddenly crumbled into dust, leaving absolutely nothing behind by which a conception of the strange vision could be preserved. Even so it fared with the old royalties and civilisations of America."

Then followed the voyages of Juan de Fuca as far north as California—mythical though some have been inclined to look upon the old Greek pilot; of Behring, the Dane, still further north to the straits which bear his name; of Deschneff, the Don Cossack, and others who explored the Arctic shores of Siberia; of Barents and Willoughby, who, in their search for a north-east passage to India, reached Novai Zemlai; of Baffin and Hudson, who explored the icy seas or straits which bear their names; and of many more of whose voyages we may have an opportunity in the due place and time of speaking. Tasman, La Perouse, Cook, and Vancouver discovered and named a thousand isles lying in the "watery solitudes of the Pacific;" Humboldt and Bonpland were making most brilliant scientific discoveries in South America, which are inseparably connected with their names; while in a different direction on land, Park, Clapperton, Bruce, and other brave men were threading the pestilent rivers of Africa.

MODERN DISCOVERY.

In modern times, if we have not such an unknown world to conquer as had our fathers, what yet remains has been, and is being, vanquished with a courage, skill, and enterprise worthy of theirs.

In the long list of explorers of the frozen seas and lands of the North, we have no names which can be pronounced with more respect than those of Franklin, Ross, Parry; not to mention many others of our own time, whose deeds are scarcely overshadowed by those of their predecessors in the same field. In African enterprise we have, within so short a

* "Peoples of the World," Vol. I., pp. 251, 299 *et seqq.*

† "Blackwood's Magazine," 1863.

THE FOUR GREAT MODERN EXPLORERS.

space as the last twenty years, shot far ahead of all the preceding centuries. Need I mention the brilliant discoveries of Livingstone, Speke, and Grant, Burton, Baker, Nachtigal, Rohlf, Schweinfurth, Cameron, and Stanley, in support of this assertion? In Central Asia our explorers have been equally busy, though, owing to a conjunction of circumstances, scarcely so successful as in the exploration of Africa. But how much have we known of Asia since the readers of these pages, still in the prime of life, were boys at school? Vambéry, in the disguise of a dervish, Colonel Montgomery's many "Pundits," and other native scientific spies, as well as the explorations of the Russian military and scientific commissions, have added, and are daily adding, to our knowledge of what was once one of the least-known parts of the world.

Australia and New Zealand, hardly known to our forefathers, except as the "Botany Bay" country to which we deputed the off-scourings unfit for Britain, where whalers and sealers touched, or as lands of which they had vague recollections of reading in the narratives of Cook or Flinders, are now great colonies, the settlement and exploration of which form a long chapter in the history of geography, and of the British Empire. In America four long railways now run over the once solitary prairies, and cities are built, or are building, on spots where, not very many years since, the writer of these lines lived for many weeks, encamped in a cotton tent, unvisited by any human being save a wandering Indian hunter or a solitary trapper.

The sea is being explored as eagerly, and even more scientifically, than the land; and the voyages of the *Porcupine*, *Tuscarora*, or *Challenger*, will in future rank with the greatest of the expeditions which have mapped the burning wastes of Africa, or the chilly steppes of high Asia. Where, scarcely a generation ago, we had only the first rude sketch of the explorer—who could often spare but ill his hands from the rifle to the sextant—the minute accuracy of the trigonometrical survey is in progress. In a few years, for example, the great jungles, rich plains, and even the mountain ranges of India, to the very confines of Tibet, will be laid down on our maps by this unerring method of chartography. Atlases are multiplying, but their number is only equalled by their accuracy. For sixpence may be had a series of maps such as Mercator could not have drawn, and embodying more information than Ptolemy and all his successors for hundreds of years were in possession of.

War, which to almost every well-constituted being is an unmitigated misery, and capable of advancing scarcely any branch of knowledge worthy of the cultivation, is to the geographer's science a gain. The *avant-courrière* of every army is a map; and though a conqueror may level cities and efface the monuments which time has spared, the next atlas will be assuredly more correct than the one which preceded the march of his battalions. A new map is almost as essential to the close of a war as a congress of plenipotentiaries, for the issue of it is sure to be a re-arrangement of the pieces on the chess-board—a "rectification" of the boundaries of countries—an interchange of nationalities, cities, and provinces. We all know how the war which lasted from 1791 to 1815 altered the colours on the map of Europe, which expressed the boundaries of the different countries. Indeed, during the continuance of the Napoleonic wars, almost every new year called for a new map. "The boundaries of states flickered to and fro; new kingdoms or republics appeared or disappeared; old states were disrupted and transformed; statesmen became chartographers; and finally a diplomatic conclave at Vienna,

After much wrangling, issued a new and would-be stereotyped edition of the map of Europe, which lasted quite as long as could have been expected. Map-making was not very quick-handed in these days; but still it laboured away, and toiled after the 'Grand Armies' in their ever-shifting field of operations. Battles have no respect for existing copyrights; humble villages or streamlets, unheard of before, will sometimes connect their names with events decisive of the fortunes of a continent, and thereafter must appear in every atlas that would keep its place in the market. What endless issues of maps there were during the short war in the Crimea, until every hamlet and foot-road in that half-deserted and very unimportant corner of the world became as well known to us as if it had been an English county." The same was true of the Abyssinian war, when maps of a region little known even to geographers, poured from the lithographie presses with astonishing rapidity and profusion. No sooner was the little war in Ashantee announced as imminent, than maps of the Gold Coast, superior in detail and accuracy to anything which had gone before, appeared in every shop-window, and in almost every illustrated paper; and no matter to what part of the world notice is likely to be attracted, a map of that region is about as certain to follow as are the descriptive letters of "our special correspondent." It was the same in Afghanistan and in Egypt.

Man in his migrations over the world alters its physical geography, and transfers the products of one land to another. In America and in many of our colonies he has caused the sugar-cane and maize—the wheat of the Indian—to grow in room of pines and primeval forests. Sheep and oxen have taken the place of the bear, the beaver, or the buffalo; while in more tropical regions the lion, the tiger, and the elephant have been compelled to give place to animals more useful, or more subject to the control of the new lords, who have asserted their reign over what were once the haunts of these kings of the forest.

THE UNKNOWN OF THE NINETEENTH CENTURY.

Not a year but is adding to our knowledge of the world. The great regions may now be known in all their broad details, though none are known with that accuracy which is essential for the purposes of the geographer. Still, the explorer need not sit down and weep because there are no more worlds to conquer. There are two and a half millions of square miles around the Poles, of which we know nothing; while there are few parts of the Arctic regions as a whole, Greenland excepted, with which our acquaintance is anything like accurate. Of even the interior of Greenland, a country known and partially settled by Europeans for more than 900 years, we are yet entirely ignorant of anything very tangible. The Antarctic regions are as yet almost a *terra incognita*, and are likely long to so remain. The interior of Australia yet remains to be fully explored; while in regard to much of Tibet we are wholly ignorant. Even Central America, circumscribed as is the region for exploration, cannot be said to have yet yielded up its secrets to the many adventurers who have penetrated its forests and savannahs. Yet, with all the advances of modern exploration and research, in spite of the atlases, charts, works of travel, and geographical text-books, the name of which is legion, there is no science of which otherwise educated Englishmen—and I might have said all Europeans—are so ignorant.

We may laugh at the English ambassador at the Court of Rome in 1843—when

Pope Clement VI. had presented the Canaries, or Fortunate Isles, to the Count de Clermont—leaving the Papal Court in alarm, and hastening home to acquaint his king that the Pope had given away his dominions, fancying that there could be no other “fortunate isles” except those of Britain. But there remains the modern counterpart to it, of the English Colonial Minister who, on receiving a petition to establish mail communication between Australia and Van Diemen’s Land, suggested, in crass ignorance of the breadth of Bass’s Strait, which looked so narrow on his office-wall map, the desirability of throwing a bridge over it! Colonial Ministers, learned in all the learning of Greece and Rome, not unfrequently display to a “listening Senate” that they do not know how many colonies there are in Australia, that there are no tigers in Vancouver Island, or that they are not aware

MOUNT MERU, THE EARTH, AND THE INTERNAL REGIONS, CARRIED BY THE TORTOISE.
(After an original Design by a Brahmin.*)

that the zoology of a country does not exactly mean the description of its rocks and coal mines. M. de Plenis, in the preface to “New Geography,” printed at Amsterdam in the year 1700, makes also exceedingly merry at the expense of some of his own countrymen who, when they heard of the war about the *Pont Euxine*, wondered that one or other of the contending parties had not broken it down—fancying that it was a bridge.

Again, when some Frenchmen—a nation, if possible, more generally ignorant of geography than the English—heard of the Morea, they took it to be the country of the Moors, and imagined that Genoa and Lucca were rich Italian ladies. Plenis tells of some others who wrote of ships sailing from the Caspian to the Euxine Sea, all the time in unblissful ignorance that these seas had no communication with each other, or that indeed there is a chain of mountains between them. When “Gulliver’s Travels” was published most people

* According to the Hindoo belief, the tortoise is the symbol of force and creative power. It here rests on the great serpent, the emblem of eternity. The three worlds are:—1st. The upper region, the residence of the gods. 2nd. The intermediate region, the earth. 3rd. The lower, or infernal region. At the summit of Mount Meru, which is supposed to cover and unite the three worlds, the triangle, the symbol of creation, may be seen gleaming.

supposed Laputa and Lilliput were real countries; and when the war broke out between the Northern and Southern States, many people for a time believed that North and South America had become hostile to each other. Why the greatest commercial nation in the world—the one that has an ever-increasing chain of great colonies encircling the globe, and which has done more for geographical exploration than any other—should as a rule be, in the persons of the majority of its individual components, so ignorant of the first elements of the science, it is difficult to comprehend. That such is the case there can, however, be little doubt. Possibly the way geography is taught in some schools, or the total absence of its teaching in others, may be the cause of this deficiency in the education of otherwise intelligent and well-informed people—added to the condensed encyclopedian character of the text-

SYMBOLICAL REPRESENTATION OF THE EARTH, ACCORDING TO THE EGYPTIANS.

books generally in use. These books, in most cases, by endeavouring to cram the greatest possible amount of hard, uninteresting, and frequently unimportant detail in the smallest dimensions, when most of these particulars can be far better presented to the eye in a graphic form by a glance at a map, have succeeded most dismally in rendering a science which could be as entertaining as a well-written work of travel—and indeed is nothing else than a *résumé* of travel—about as interesting as a treatise “On the use of the Globes,” and as valuable as the catalogue of a stamp collector’s album. There is no reason why the science of geography should not be made interesting. It would be presumptuous to claim that in the volumes to which these lines form at once the preface and introduction this will be done. But at least we will endeavour—with the aid of friends and fellow-travellers in many parts of the world—to give the essence and main facts which modern exploration has brought to light regarding the globe we live in, without wearying the reader with a multiplicity of uselessly minute detail; and before we have gone “around the world,” to show, in the words of Burke, that “Geography is an earthly subject, but a heavenly science.”

THE LANGUAGE OF GEOGRAPHY.

A map is, as every one knows, a portraiture of the figure of a country on a flat surface, on which the rivers, mountains, lakes, cities, and other geographical peculiarities of the region are laid down, according to certain well-understood, though more or less arbitrary, signs; while the term *chart*, though exactly the same thing, is in English generally reserved for a map of the coasts of a country and of the sea-bottom—on a scale minute enough to be useful for the purposes of the navigator. The earth is, however, in shape more or less globular, though not exactly round. The familiar simile that it is like an orange, rather flattened at either end, or Pole, is near enough for our purpose. The surface of this globe, being depressed in some places by deep valleys and river-courses, and in other places heightened by lofty mountain-ranges, cannot have the same diameter throughout. It is, however, rather broader than it is long. In other words, a line drawn from the southern end, or Pole, to the northern end, or Pole, would have an average length, "taking one place with another, of 7,899.1 miles; while the mean Equatorial diameter, or its breadth, ascertained in the same manner, at the point exactly between the Northern and Southern Poles, in the line of the Equator, would be more, viz., 7,925.6 miles; the mean or average diameter being thus about 7,912 miles.

The earth contains a mass of 259,801 millions of cubic miles. It is generally believed that the centre of this great mass is in a fluid condition, and that what geologists call the crust of the earth is only a solid rind on the outside, a very few miles in thickness. By those persons who follow the theory founded on the well-known fact that the earth increases gradually in warmth the deeper we penetrate into it, the lava vomited out of

volcanoes is pointed out as one of the many proofs of the justice of the view. On the other hand, the correctness of the theory is doubted by some, whose opinion is entitled to considerable weight, who argue that there are only cavities containing liquid matter, here and there, throughout the outer limits of the whole solid mass. Be this as it may, it is a point into which, in a book of this nature, it is hardly worth inquiring too closely, since the ground for holding either belief is about equally imperfect: the rotundity of the globe is universally acknowledged; it follows, therefore, that any map on the usual flat surface can only imperfectly express the shape and relative size of the countries; and that it is only maps drawn on a globe that can at all represent the mountains truly.

Circling a globe, or drawn across a map, are certain parallel lines, called the lines of *latitude*—these lines being north and south of the Equator, and being calculated in degrees, minutes, and seconds. Again, running from north to south, and converging at both Poles, are the lines of *longitude*. Hence, in talking of any place, we say that it is, for instance, latitude $48^{\circ} 15' 5''$ north—that is, forty-eight degrees, fifteen minutes, five seconds north of the Equator. If the place lay south of the Equator, we should in like manner describe the place as in south latitude. In describing the longitude of the place, we say that it is east or west, though we have no settled point from which we calculate east or west, every nation selecting their own *first meridian*, or point from which they calculate. In English maps and globes the first meridian is a line supposed to pass from Pole to Pole through the Royal Observatory at Greenwich; hence we talk of any place having a longitude east or west of Greenwich. Greenwich is now being adopted by many other countries as a “first meridian;” and will, no doubt, be in time universally adopted as such.

At the Poles there is, of course, no longitude, and the more we approach to the south or north, the nearer are the lines of longitude to each other. The figures expressing the degrees of longitude are printed on the top of the map, while those of latitude are at the sides. When the figures increase from left to right, the longitude is east; but when they increase from right to left, the longitude is west. In addition to the lines of latitude and longitude, there are others engraved on a map, or globe. These are the Equator or Equinoctial Line, the Ecliptic, and four smaller ones—the Arctic and Antarctic Circles, and the Tropics of Cancer and Capricorn. The *Equator* we have already spoken about as a circle equally distant from the Poles, and which accordingly divides the earth into northern and southern hemispheres. The *Ecliptic* is a circle which cuts the Equator obliquely at two opposite points, and represents the sun's path in the heavens. The two Tropics are situated parallel to the Equator, at about $23\frac{1}{2}$ degrees from it. The northern one is the *Tropic of Cancer*, the southern the *Tropic of Capricorn*, because they touch the Ecliptic at the beginning of these astronomical signs. In the same way the Polar Circles are situated $23\frac{1}{2}$ degrees from the Poles, and are denominated the *Arctic* and *Antarctic Circles*, in respectively the northern and southern hemispheres.

Land and water are not equally distributed over the world. The eastern hemisphere—*i.e.*, all the world lying east of the meridian of Greenwich—contains the continents of Europe, Asia, Africa, and Australia, in addition to many large islands; while the western hemisphere has only Greenland, America, and a few small islands. About seven-tenths of the surface of the earth are composed of water, and about three-tenths of land; in other

words, about 51,250,000 square miles are land, and 145,600,000 are water, giving to the globe 196,850,000 square miles of area. About seven-twelfths of the water are in the southern hemisphere, and five-twelfths in the northern. The same eminent mathematician and physical geographer—Dr. James Bryce—from whose calculations these figures have been derived, also points out that in the Old World the land extends in an unbroken mass over almost the entire breadth of the eastern hemisphere, but that the vast proportion of the mass is on the north of the Equator.

In the New World, on the other hand, the land is developed along an axis running nearly north and south, more than two-thirds of the circumference. This length is determined by a vast chain, the most continuously elevated in the globe, extending from 56° S. to 71° N., close to one side of the continent; while the great breadth of the continent in Brazil, the United States, Canada, and Labrador, is dependent upon great but much less elevated ranges, having a general parallelism to the sea-coast on that side. In the Old World, the development depends upon the direction of a great axis of elevation, which stretches, with little interruption, but with considerable undulations, from the west of Spain to the Sea of Okhotsk, and to Behring Strait, on opposite sides of which the chains of the two continents are brought into close connection. Together these form a vast girdle, encircling the Pacific and Indian Oceans, surrounding the Mediterranean—for the Atlas is part of the system—and ending abruptly towards the oceans. The declining slopes are directed towards the interior of the continents. Africa and Australia have a structure different from that of the other continents; they have elevated borders and an interior comparatively low and level, except in some disconnected tracts. Of the Antarctic continent we only know that it has an ice-bound coast, with lofty volcanic peaks in the interior. In due time we shall have occasion to travel with Wilkes and Ross in the direction of that mysterious frozen land surrounding the South Pole.

The mean or average elevations of the different great regions of the world have been calculated as follows:—Europe, 671 feet; North America, 781 feet; South America, 1,132 feet; Asia, 1,157 feet, above the sea-level—i.e., if all parts of each region were smoothed down to an equal level.

There are other terms which we shall have occasion to use, but which are so familiarly known that we need only refer to them. These are—a *continent*, or large tract of land; an *island*, or land surrounded by water; a *promontory* or *cape*, a more or less elongated portion of land running into the sea; a *peninsula*, or land almost surrounded by water; and an *isthmus*, or narrow neck of land joining two portions of land together. The words *ocean*, *sea*, *lake*, *bay*, *gulf*, and *strait* require no explanation. These are parts of the common stock of language, and, though originally used by geographers only, cannot now be classed among technical expressions. Others more local and less known will be explained as we proceed on our travels. These are dry details, which we shall no doubt be told are “familiar to every schoolboy.” But that omniscient youth is credited with so many and varied departments of knowledge which are but faintly present in the memories of those much older, that it appeared desirable to preface the more interesting parts of our volumes with what, if it cannot claim the merit of being readable, cannot be denied that of utility.

ARCTIC SCENE.

CHAPTER II.

THE ARCTIC REGIONS IN GENERAL.

WE must commence our journey somewhere; and though the inhospitable regions of the North are generally the part of the world last reached by a traveller the most cosmopolitan and adventurous—if he extends his wanderings so far a-field—yet for that very reason we find it most convenient to make these remote outskirts of creation the starting-point of our voyages. We shall see many lands richer, fairer, and even more interesting; but we shall be in a better position to compare the exuberance of tropical life with that more familiar to us, if we do not plunge all at once into the equatorial forests, or weary the reader with a twice-told tale of what is already daily before his eyes in the temperate parts of the world.

The geographer styles all parts of the world north of latitude $66^{\circ} 30'$ the Arctic or Frozen Regions, and the imaginary line drawn on the map of the world at this distance from the North Pole, the Arctic Circle. Take North America, for example: this line in its circuit touches on the Behring Strait side, Hotham Inlet and the northern portion of the Great Bear Lake, in the middle portion of its circuit across the continent; while it sweeps across the Fox Channel, and the middle of Davis Strait, dividing Greenland, as at present known, into

about equal halves, and barely infringing, as it reaches the European seas, the northern portion of that mis-named island of Iceland, called, one may reasonably suppose, on the *lucus a non lucendo* principle, the land of ice, because there is no ice on its shore, except that which now and then drifts from Greenland. In Europe it leaves a large part of Norway and most of Lapland to the north of it, while nearly all the great Russian rivers which have a northern outlet are, for a considerable distance of their lower reaches, also within the charmed circle. Siberia, in popular opinion, is throughout sufficiently Arctic; yet we must remember that it is only a part of Siberia which is within the Arctic regions of geographers, whatever it may be in ordinary parlance; and the whole peninsula of Kamshatka, dreary as it may be, lies without the line which is supposed to divide the Frozen from the Temperate Zone. It thus appears that no little portion of the possessions of Russia, Great Britain, the United States, Denmark, Norway and Sweden, belong to that region which few can mention without an involuntary shudder—the dreaded yet mysteriously attractive Arctic region.

Popular impressions are often far from the truth, and in regard to the Arctic regions they are undoubtedly so. A treeless land would be, in the opinion of most people, the idea which would suggest itself in regard to the regions in question. Yet this, though true, is not all the truth. Within the Arctic Circle are found trees, often forming considerable though stunted forests. In Eastern Siberia pines and other trees come down almost to the water's edge; while over all Western Siberia, Arctic Russia, and Lapland, the tree-limit runs within the Arctic Circle; trees extend even to the North Cape. In Greenland we find, even in the most southerly parts of it, no herbage more worthy of the name of tree than the stunted birch, which in the more sheltered valleys of that country—equally inappropriately named with Iceland—attain the proportion of little shrubs; and it is not until we come to the milder latitudes of the Pacific that the tree-line, which had described a southerly curve in the cold regions of Central North America, again rises to the north, and until we reach the shores of Behring Strait we find nothing which we can dignify by the name of trees.

Nor must we suppose that even for a considerable distance outside of the Arctic Circle is the country less worthy of the name of the Frozen Lands than inside of it. The southern point of Greenland is in about the same latitude as Cape Wrath in Scotland, yet it is sufficiently frozen to compare with lands lying far within the Arctic Circle. The same may be said of Hudson Straits, on the shores of which Eskimo live, and of many other parts which, geographically, lie within the limits of Polar lands. Latitude or the distance north has little to do with cold. The extreme of cold, it is generally believed, will not be found at the North any more than at the South Pole; but in about latitude $70^{\circ} 5' 17''$ N., longitude $96^{\circ} 46' 45''$ west. In this spot will be found in all probability not only the extreme of cold, but it is also remarkable in so far as it constitutes the "magnetic pole," or point to which the compass points;—for, as the reader doubtless knows, the needle does not point due north. This interesting spot was discovered by Sir James (then Commander) Ross, a famous Arctic and Antarctic navigator, whose name we may yet have occasion to mention in connection with the exploration of these frozen confines of the earth. When he suspended horizontal needles in the most delicate manner possible, they showed not the slightest tendency to move in this locality. Though Nature had here placed the home of one of her secrets, the locality was indicated by nothing remarkable. There was merely a low flat coast, rising about a mile, inland with ridges fifty

or sixty feet high. Beyond this, no monument denotes the spot which Nature "has chosen as the centre of one of her great and dark powers."

Neither does the greatest amount of snow fall within the Arctic Circle. Taking Greenland for example: though the amount of snow is in winter considerable, and is longer in clearing away near the coast than further south, yet north of 70° the quantity which falls is less than it is outside of the Arctic Circle. The Arctic regions are also by no means the regions of greatest cold. It was even believed by some geographers—we confess not without arguments worthy of attention—that around the Pole we should find a comparatively open sea, or at least one not so nearly choked by ice as might be expected from the high north latitude. The waters are frozen, because, so far as we yet know, the greater portion of the northern parts of the globe is occupied by the "Arctic Ocean;" but the cold is so intense in the heart of Asia and of America, that doubtless, if sea existed in such places, it would be also frozen. The truth is, the Arctic Circle, though unfortunately adopted by some physical geographers as the southern limit of the Arctic region, is in reality in no way a physical boundary of the regions of ice and snow from the regions where the climate is more temperate. It is one of the lines which the astronomers have found it necessary to draw on the globe for their own convenience, and merely expresses, to use their language, a circle drawn round the northern end of the earth, at a distance from the Pole equal to the obliquity of the Ecliptic—or the sun's apparent yearly path among the stars from west to east. For the purposes of the physical, as distinguished from the astronomical, geographer, perhaps the tree-limit would have been the best Arctic Circle; but it is really impossible to confine vague climate and climatic influences within any hard and fast line; and, accordingly, the Arctic Circle of non-astronomical people must be like a "movable feast"—not very settled. Fortunately, it is an easier task to give a general idea of the appearance of Arctic lands. They may be conveniently divided into three great divisions—the wooded country, the mountainous country or highlands, and the mossy lowlands.

THE ARCTIC WOODLANDS.

The wooded country we have already spoken of is confined entirely to some portions of Siberia, Russia, and Lapland, and to North-Eastern America, down the shore of Behring Strait. The wooded banks of the Yukon touch the Arctic Circle, and forests of white spruce are found on the Noatak, a river which falls into Eschscholtz Bay, which infringes on the Arctic Circle. In Lapland the spruce ceases at about the 68th parallel, and the Scotch fir at the 69th; but in Norway, owing probably to the presence of the warm Gulf Stream which sweeps along the coast and into the Arctic Sea—at least as far east as Novai Zemlai—we find forests of Scotch firs sixty feet in height as far north as Altenfjord, and birches about forty-five feet high in an equally northern latitude. In latitude $70^{\circ} 28'$ the hardy Scotch fir still maintains its ground, though the spruce fails a degree or so further south. In the vicinity of Hammerfest, a well-known Lapland town, in latitude $70\frac{1}{2}^{\circ}$ N., there are dwarf alders and aspens, bird cherries, raspberries, and currants. In the Scandinavian Peninsula, probably also owing to the warmth which a sea unencumbered, and in addition laved by a current of a higher temperature, affords, barley is cultivated as far north as

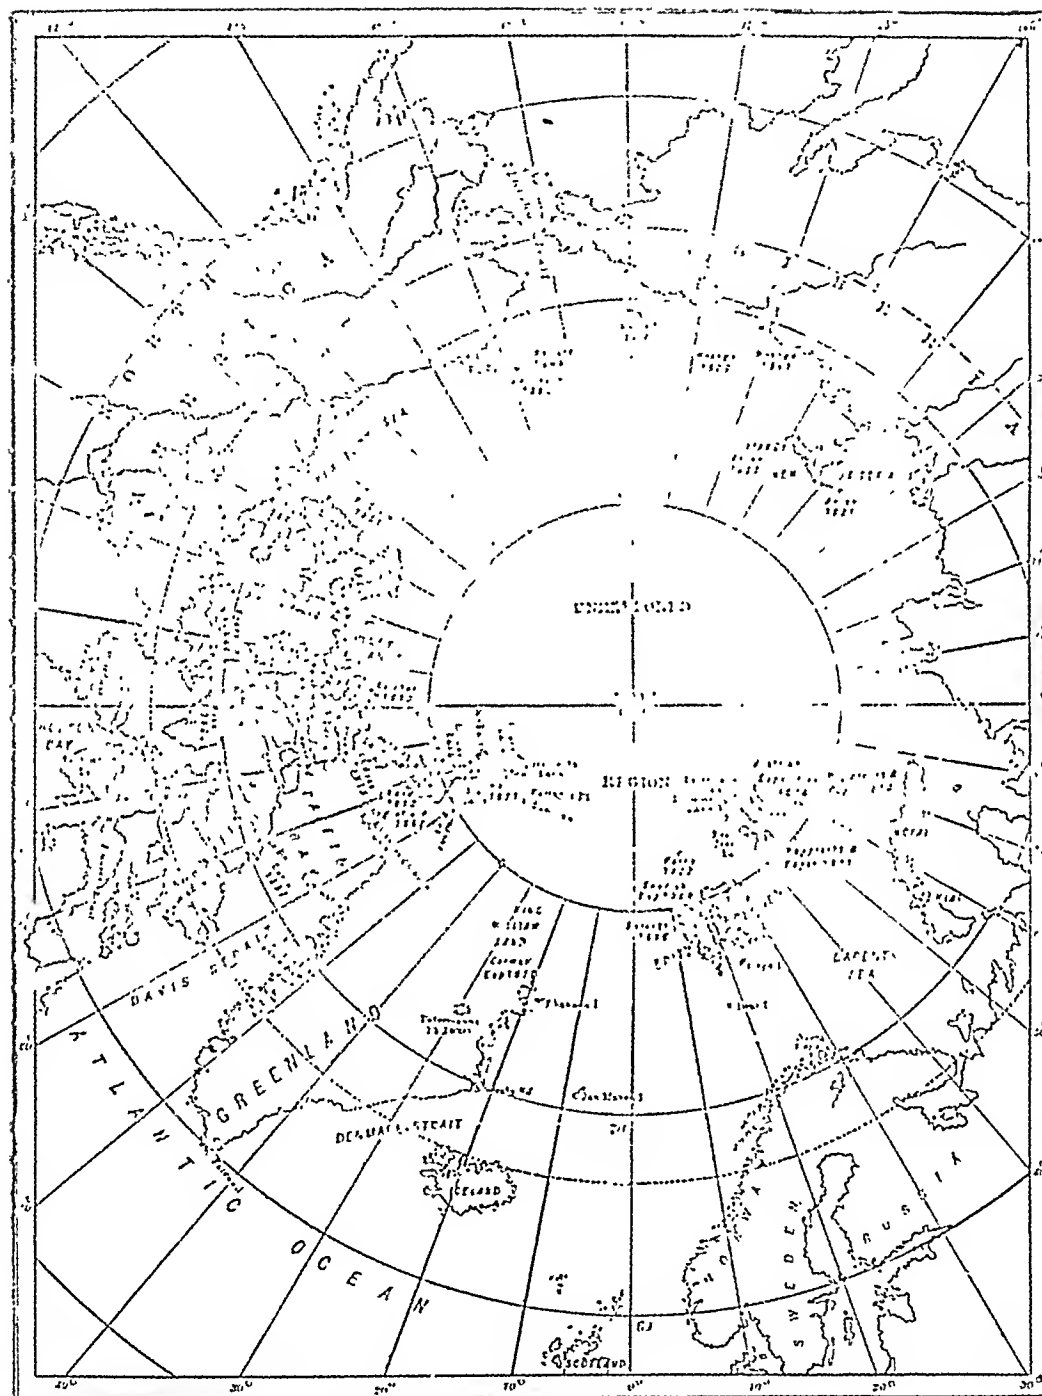

the 70th parallel, the latitude of Disco Island, on the Greenland coast, and oats up to the 65th, "in sheltered valleys, where rocks and cliffs reflect the sun's rays with much power" (Richardson). Compare this with the *Meta incognita* of stout old Martin Frobisher, now called Cumberland Gulf, but until comparatively recently as unknown as it was in the time of Queen Bess's gallant knight. In this locality, which lies far south of the Arctic Circle, inland glaciers and bleak mossy islands, at best covered during the short summer with dwarf creeping birch and cranberry, and during the long winter with

VIEW OF NOUTSOAK, OR FOUR ISLANDS POINT, NORTH GREENLAND. (From an Original Sketch by Herr Tegner.)

a blanket of snow, the sea being frozen all around, form the bleak scene of desolation which meets the eye, all pointing out that latitude, apart from other circumstances, has but little to do with climate.

In the valley of the Mackenzie, Sir John Richardson tells us that the spruce fir is the most northern tree that forms a forest, reaching to a much higher latitude than the pines—contrary to what occurs in Norway, where the pines are the most northern. "In latitude $68^{\circ} 55'$ N. the trees, which up to this parallel cover the immediate banks of the river and the islands of the delta, terminate suddenly in an even line, probably cut off by the sea-blasts. Beyond this line a few stunted spruces and scrubby canoe-birches straggle up the acclivities, struggling for existence, and clinging to the earth. The forest is formed by the spruces, but among these there are many canoe-birches, of much slenderer growth,

(The dotted circle indicates the Arctic Circle.)

their stems not exceeding five inches in diameter." The balsam poplar—or as it is sometimes, though erroneously, called, the cotton-wood—(*Populus balsamifera*), and a species of alder (*Alnus viridis*), grow to the height of twenty feet, and a willow (*Salix speciosa*) to that of twelve feet near the termination of the woods. Most of the hills skirting the river in these latitudes are bare, a few scattered trees being the only trace of the forests which, further to the west, are found in an equally northerly position. Pines are here more chary of the cold than in North-eastern Europe, the Banksian pine—*Pinus Banksiana*—not reaching within the Arctic Circle, and *Pinus resinosa* finding its northern limit in latitude 57° —a lower latitude than that of Aberdeen, in Scotland—here again demonstrating the effect of great land masses, independent of northerly locality, on the temperature of a country. In America no wheat has ever been raised within six degrees of the Arctic Circle, while at Hammerfest, in Lapland, a few ears of rye have been raised now and then as a curiosity, though they have rarely if ever fully ripened. Radishes, turnips, lettuces, and parsley plants have been reared; and we shall see by-and-by that radishes grow tolerably well in the same latitude in Greenland.

At Fort Good Hope, on the Mackenzie (in latitude $66\frac{1}{4}^{\circ}$), a few turnips and radishes, and other culinary vegetables, can be grown in a sheltered corner which receives the reflection of the sun's rays from the walls of the house; and on Peel's River, rather more than a degree further north, all attempts to raise esculent vegetables have failed. A few cresses made an attempt to attain something like perfection in a climate even too uncongenial for this humble plant. Turnips and cabbages came up about an inch above the ground, but, we are told by Sir John Richardson, withered in the sun, and were blighted by the early August frosts. Dreary enough, at best, are these stunted forests, even when in all their summer gaiety—the sepulchral mossy hangings of lichen and moss giving them a weird, depressing aspect; but doubly so are they during the winter, when the swampy soil in which the trees grow is frozen hard, and covered with congealed snow, which clings to the feathery branches, or depends from them in jagged icicles, when the retiring sun begins to alternately melt and freeze the fleecy covering which has for so long shrouded the landscape in white. The trees freeze "to their very centres," and are not thawed till the end of March or the beginning of April. But this matters little; for it is not until rather late in the summer that the sap can ascend, there being no free moisture in the iron-bonded soil. In many places the ground is frozen to a great depth. In one locality in Siberia, in latitude $68^{\circ} 42'$, Wrangell found that the summer thaw did not penetrate to a greater depth than six or eight inches. At Jakutsk, in Siberia, more than six degrees further south, frozen soil was penetrated through to a depth of 382 feet, until water flowed from beneath it. In Greenland, on the Mackenzie, in Hudson's Bay, and in other Arctic localities, the soil will often freeze during the winter to a depth of from ten to twenty feet. During the winter to attempt to dig a grave, where there is sufficient soil, is hopeless. The dead are either kept until summer—a matter of no difficulty in this cold climate—or are interred under heaps of stones above ground. Even at York Factory, in Hudson's Bay, in a latitude about the same as that of Perth, in Scotland, the surface soil at the close of summer will sometimes not be thawed more than three feet. Often in northern latitudes, bodies, if covered over with a layer of earth or stones, will remain uncorrupted for several years.

THE ARCTIC HIGHLANDS.

We have thus shown that the popular idea, which associated treeless wastes with the Arctic regions, is not altogether a correct one. Still, though the axiom that what everybody says or thinks must be true, is not altogether a rule without an exception, there is generally, as in the case under question, some good ground for an impression very widely entertained.

The greater portion of the Arctic region is bleak and treeless in the extreme; the only woody plants found being the dwarf willow, blackberries, cranberries, or birches, which form a cover to the boggy ground. Though there is little extremely elevated land in the Arctic regions—Petermann's Peak (about 14,000 feet), and Payer's Peak (about 7,000 feet), on the east coast of Greenland being about the highest points—and mythical or "hymnal" though "the icy mountains" are, yet much of it is of considerable elevation. The impression of one's first approach to an Arctic land lingers long in the memory. For weeks you may have been tossing about in mid-ocean; gradually the ship gets into quieter waters; the fogs, which for days past have obscured any view beyond a few yards from the ship, clear away; the land haze is seen; the sun comes out of the leaden snowy sky; a bit of ice grates against the ship's side; and your attention is called to a white object tossing in the sea, a mile away. It is the first iceberg; and with the voyager's mind filled with extravagant notions, derived from the pictures he has seen in books, he is apt to be disappointed with his first iceberg. The great mountains of ice "grow on one" after a time. You approach still nearer: icebergs become disagreeably numerous; inquisitive seals raise their heads above the cold water; a white whale, or a little herd of narwhals, puff around the ship; or it is just possible that, far off, the thin line of vapour projected from its nostrils proclaims that a whale is "blowing." If you are near a cod-bank, the great fin-back whale—of little value either for its blubber or whalebone, though of much greater size than the "right" whalebone whale—will be sure to be seen in great numbers.

The land is now close at hand. The narrow band of ice known as the ice-foot—the remnant of that great field which, during the past winter, had stretched many miles from the shores—still hangs to the cliff, and will remain so until the warmth of the air, or the laving of the waves, heated above the freezing point by the long summer sunshine—a continuous day of four or five months (see engraving, p. 25), to be succeeded by an equally long night—breaks it off, and sends the fragments to mingle with the floating pieces of the winter's floes, which are ever and again scraping up against the ship's side, or bumping against it in a manner apt to alarm the voyager who, for the first time, experiences such a sensation. He soon becomes accustomed to these and still stranger concomitants of the land he is to live in for the next few months, or it may be years. Before him lies the line of coast. A snowy eminence of a greater height may be seen in the background, or here and there in the distance; but the general elevation of the cliffs is rather low. If gneiss be the rock of which they are composed, it is rounded and worn into bosses and knolls, as if ice had passed over it here and there; and even the more jagged scrap of whinstone is flat-topped.

as if the same silent but all-powerful agent had passed over like a huge plane, smoothing down the surface of the country. The snow has melted off the ground near the shore, but the more elevated plains are still covered with their winter's coat. The black of the cliffs is relieved, not only by the patches of unmelted snow, but by the glaciers, which creep down from the interior, or from the higher elevations, to the sea, and break off into the form of the icebergs which we see floating about us. A few islets lie off the coast, separated from the mainland by narrow channels, probably still choked up by ice in the open spots

EIDER DUCKS. (*Somateria mollissima*.)

in which eider ducks and loons are swimming about. You land on the "ice foot," and for the first time stand within the Arctic Circle. The ground off which the snow has melted is boggy and moss-covered, but the rocks are smoothed and shaved by the ice which it is now apparent must, at some former period of the history of the country, have ground over it. Wherever we can get a view of the rock we see signs of this. In addition to being rounded and worn, everywhere there are deep grooves, just like those we see in the rocks in an Alpine valley over which a glacier has once moved, or in a Scandinavian or Scottish glen, where the researches of geologists tell us the same thing has happened. Rocks, in many cases of a different geological formation from those in the vicinity, lie scattered everywhere over the country, or are perched in positions which leave no doubt to the practised eye of an educated naturalist that they were dropped in those places from the icebergs which, in remote ages, floated over the submerged surface of the country.

A MIDSUMMER MIDNIGHT IN THE NORTH OF NORWAY.

The Arctic regions, like every other portion of the world, have undergone many changes—some of them much stranger than those we have mentioned. Climb any elevation, and the scene which meets the eye is cheerless in the extreme. A few ptarmigans rise up at our feet, a half-frozen lake lies in the hollow, an Arctic fox is barking its “Akak ah!” on a rock. If we see a solitary reindeer our walk rises to a sensational point, but the chances are that we are driven by a snowstorm to our boat, and for a time the few sea-fowls, which were beginning to make lively the open “leads” among the ice-fields, are as silent as their surroundings. The whole scene is cheerlessly chilly; but yet it has a charm of its own, which it is impossible to explain to those who have not sailed in these high latitudes.

Such are the Arctic Highlands—a name which the reader must not, however, confound with the country north of Melville Bay, in Greenland, to which that enthusiastic Scot, Sir John Ross, under the idea that the region in question was better, and the people bolder, than those of the more southern country, applied the same name!

THE ARCTIC LOWLANDS, OR TUNDRAS.

In various portions of the Arctic regions there are tracts of comparatively level land, such as the most northern portion of Labrador, bordering Hudson's Strait, a great portion of the western side of Baffin's Bay, Melville Island, &c. Sir John Richardson will even include Greenland, but this is erroneous. Greenland is certainly one of the great regions of the Arctic Highlands. In America and in Siberia the level lands, spread out from the eastern slopes of the mountains, change as they lose in altitude, and become more abrupt on their western slopes as they approach the Polar Sea. In the New World these tracts are called “barren ground,” and in Siberia and North Russia “tûndren,” or “tûndras,” as the word has been Anglicised. They are also found in Lapland, where they are known to geographers under the much more classical name of *terre damnata*—accursed lands—which Linnæus, the famous Swedish naturalist, applied to them.

The barren ground district of America is seen in its most marked form near Hudson's Bay, where it reaches as far south as the 61st parallel of latitude. It receives its name from the entire absence of trees in such tracts; but it abounds in lakes, and is traversed by the Great Fish River, and many minor streams. It is not altogether flat, for there are rocky hills of moderate altitude—such as the Stony Mountains of Samuel Hearne, one of its earliest explorers, a chain which has an elevation of about 1,500 feet. The barren grounds become narrower to the north of the Great Bear Lake, and, according to the celebrated explorer whom we have quoted, terminate at the delta of the Mackenzie. Under this name the Hudson's Bay fur-traders term all the treeless parts of North America; but, of course, in what we have called the Arctic Highlands there are also many tundra-like tracts, though still not of the extent which we see in the barren grounds, and similar low-lying regions in Europe, Asia, and America.

During the winter the barren grounds in America are swept by the icy “blizzard” to such an extent as to render them uninhabitable by the hardy Indians; and even the reindeer keep by the edge, until able to retreat to the shelter of the woods in storms. The drier spots are

densely clothed with lichens of various species, mixed up, in the moister places, with the reindeer moss, the *Kalmia*, the blackberry, the dwarf Lapland rhododendron, the cranberry, the *Ledum*, or Labrador tea (from its leaves being used by the trappers as a substitute for the true China herb), the bearberry, the *Andromeda*, the cloudberry, the Arctic bramble (*Rubus arcticus*), and the various species of dwarf creeping willows found so commonly in the Arctic regions. In favourable and sheltered meadows, Sir John Richardson—who, when surgeon of Franklin's early expedition, shared many hardships in these dreary tracts, and was therefore well able to speak of them—describes grasses and bents flourishing in considerable variety, and on the banks of streams sometimes a growth of *Salix speciosa*, a kind of willow three feet in height, or even more, may now and then be seen. There are in addition many flowering plants of less note, but “which serve to cheer the traveller who traverses these wastes in the fleeting summer.” The Siberian tundras are less known; but, from the description which Wrangell and other travellers give of them, they seem to be almost identical, except in the species of plants which are found on them, with the American barren grounds. “In travelling across the wide tundra in dark night,” wrote the Russian explorer just named, “when the vast plain is vested in impenetrable mist, or when in storms or snow-torrents the traveller is in danger of missing the sheltering hut, he will frequently owe his safety to a good dog, who will be sure to bring the sledge to the place where the hut lies deeply buried in the snow, and will suddenly stop and indicate where his master must dig.” After coming from these naked, frozen, moss-covered tundras into the valleys of the Anni, which are sheltered by the mountains from the prevailing cold winds, and where birches, poplars, willows, and low creeping junipers (*Juniperus prostratus*) grow, Wrangell remarks that the traveller imagines “himself transported to Italy.” The same feeling is experienced by those who have been long in the Arctic regions. Three different times has the writer of these lines approached England, after a stay of a shorter or longer extent amid the ice and snow of the Arctic regions. Under such circumstances, even the bare tundra-like Shetland and Orkney Isles look home-like and cheerful, while the rich woods along the shores of the Danish Oresund excite an enthusiasm in their autumnal poverty which they never aroused in their summer splendour in former days, when comparisons had not made the treeless land we had left behind “odious.” Old Willem Barents, and other of the time-honoured searchers after an Arctic passage to India and China, repeatedly speak of the pleasant change it was to see the trees and grass of civilised Europe, after their eyes had been dazzled and dulled so long by the monotonous whiteness of ice and snow—snow and ice.

In the north of Russia, about the Kanin Peninsula and the neighbouring country, the tundras can also be seen in great perfection. To this northern peninsula, guarding the eastern entrance to the White Sea, the wandering Samoyedes—the Old World representatives of the American Eskimo*—crowd during the summer months, in order to seek in its chilly atmosphere an asylum from the plague of mosquitoes, which infest northern and tropical countries with equal vigour. The sufferings of the reindeer from these insects are described by Mr. Rae as incredible. Sometimes their faces and heads stream with blood from their

* For a description of these people see “Peoples of the World,” Vol. I., pp. 17—32, and the books there mentioned.

bites, and the poor animals are driven almost crazy from their irritating stings. If the Samoyedes did not migrate northward during the summer, they would probably lose whole herds of their reindeer—animals which are so essential to their existence. It is also noticed in America that the deer seek the mountains during the summer to escape the mosquitoes; and, accordingly, the hunter seeks his prey during the warm months near the limits of the eternal snow which covers some of these heights, or in situations from which the cool breezes have driven these buzzing enemies of bipeds and quadrupeds alike. Yet, even in

GROUP OF WALRUS ON THE ICE-FIELDS.

these cold northern wastes, near the Kanin Noss, the reindeer do not enjoy an undisturbed existence. Dotted over the tûndras are objects "that remind us of home, and we sadly reflect on our loneliness—wooden erections, in form like a cockroach, and of about the size of a wolf. They are snares for the wolves, who lie in wait—and very cold waiting sometimes—for the reindeer. The Samoyede dogs are very intelligent—in form like Pomeranian or Eskimo dogs—often white, and as often wolf-colour. They come nosing into the tents during cooking or meal times, and have to be thrust out. They keep the reindeer as well together as a Scotch sheep-dog keeps his flock; indeed, one reindeer attached to my sledge behind, when he found a dog trotting reflectively behind him, strained so fearfully round with his eyes, that I thought he would dislocate them. In his anxiety he would press forward, thrusting his antlers into my ears or the back of my neck, or his nose under my arm, and he was never at ease until the dog moved on to the front."

Mr. Edward Rae, the lively writer from whose work* we quote these lines, gives a vivid description of sledging over these Russian tûndras in long single file, the spare reindeer cantering in open order over the tûndras, but kept from straying too far away from the cavalcade—or rather *cervicade*, if the manufacture of a word be allowable—by two or three “businesslike dogs.” The travellers, Samoyede or English, sat on the flat sledge, raised a little above the ground on two runners, and thus in long procession they filed over the tûndras—“not

SAMOYEDE ENCAMPMENT.

level mossy plains, but swamps, and hillocks, and brushwood, and streams, and pools; the reindeer trotting with their swift but ungainly step; the sledges bounding from one great lump of peat to another, hissing through shallow pools, leaping fissures in the turf which they could barely span; tumbling on shifting mosses which, like yellow sponges, floated and sank, bubbling and swaying under the slight runners; tearing through brakes of sage brush, with water gurgling at the roots; rocking from side to side; climbing hillocks, or dyke-like barriers; diving into streams and out again; then the delicious, exhilarating gliding over soft, wet, level moss. We have travelled on horseback, on camels, in canoes, in karyols, in tchélegas, in caïques, on locomotives, but we know nothing equal to summer sledging

* “The Land of the North Wind” (1875), p. 259.

on the tûndras of the Samoyedes. It is a glorious sensation! The sledges are wonderful in their aptitude for such travelling; one runner is a foot under water at one second, is two feet in the air at the next; the curved fronts buried in water, while the after ends are in brashwood. At one time the sledge is bridging as quickly as thought a stream or dank pool, and in the next instant is balancing on the top of a bank. So excellent are its proportions that rarely less than three points are supported at one moment, and the balance is preserved under almost incredible conditions. Imagine a boat leaping, rolling, and pitching in a rough broken sea, and then a sledge lurching over a broken lumpy sea of turf and swamp, drawn by the fleet reindeer. Lastly, imagine two brown-skinned Englishmen in boisterous enjoyment holding on tightly, to prevent their baggage and themselves from plunging into some bottomless floating morass. How wonderfully the reindeer speed over these swaying bogs, where a man would sink in a second to his waist, and in ten seconds to his neck! How their broad elastic hoofs expand, like camels' feet! They are splendid creatures! Their motion is awkward, and their rounded bodies, slender legs, bulgy hoofs, heavy mossy horns, and down-hanging heads are not pretty to look at. Their bellow is exactly like the grunt of a pig; but their eyes and dark mouths and nostrils are beautiful. They are surprisingly intelligent and sagacious when trained, and as enduring as the 'ship of the desert.' Now and then we stopped to adjust some rein, or things that had become detached, or to send a dog after some dilatory reindeer. Sometimes the trace, passing between the deer's legs, would become displaced, and a Samoyede would run up with a shout and leap from his sledge. I believe there is no summer sledging elsewhere, unless it be among the neighbouring nomads, the Ostiaks,* beyond the Oural Mountains. The Laplanders do not sledge in the summer; indeed, their little punt-like sledges would be quite impracticable for it; and the heat in their sheltered land, where wind rarely blows at midsummer, would be too much for the reindeer. Away, on all sides of us, lay the tûndras—softer in outline, but not unlike the fjeld of Norwegian Lapland—gay in summer, with staghorn and reindeer mosses, club-moss, white and red lichens, cranberries, and the Arctic flowers. These tracts are not unenjoyable even on foot during the end of summer, when the surplus moisture from the spring rains and the melting of the snow has disappeared, even though the traveller be driven to the verge of insanity by the myriads of mosquitoes which, during hot days, swarm in the air.

It was the condition of these bogs when they were almost impassable from the causes mentioned that young Carl Linnæus, in the course of the journeys on which he was sent by the Swedish Academy in 1732, so quaintly described in his "*Lachesis Lapponica*:"—"We had next to pass a marshy tract, where at every step we were knee-deep in water; and if we thought to find a sure footing on some grassy tuft it proved treacherous, and only sunk us lower. Our half-boots were filled with the coldest water, as the frost in some places still remained on the ground. I wondered how I escaped with life, though certainly not without excessive fatigue and loss of strength." A guide who accompanied the young naturalist was dispatched to seek assistance, and on his return was "accompanied by a person, whose appearance was such that I did not know whether I beheld

* The Yenosei Ostiaks are closely related to the Samoyedes; those of the Obi are more akin to the Finns.

a man or a woman. Her stature was very diminutive; her face of the darkest brown, from the effects of smoke; her eyes dark and sparkling; her eyebrows black. Her pitchy-coloured hair hung loose about her head, and on it she wore a flat red cap. She had a grey petticoat; and from her neck, which resembled the skin of a frog, were suspended a pair of large loose breasts of the same brown complexion, but encompassed, by way of ornament, with brass rings. She addressed me, with mingled pity and reserve, in the following words: 'O thou poor man! what hard destiny can have brought thee hither, to a place never visited by any one before? This is the first time I ever beheld a stranger. Thou miserable creature! how didst thou come, and whither wilt thou go?' In a word, the student from Upsal thought, as did another famous Lapland traveller, who came into the same region long after him: "So at last we ended our toilsome journey into Lapland—the most curious that ever was—one that I would not have failed to make for a great deal of money, and that I would not re-commence for much more." So writes M. Regnard—that *rara aris in terra*—a Frenchman in a northern latitude.

CLIMATE.

When Benjamin Franklin, in "Poor Richard's Almanac," makes the jocular prophecy that in the month of February "there may be expectations of much ice and snow in Greenland," he expresses a very safe opinion regarding the popular belief in the climate of the Arctic regions. There is probably no zone of the world extending over such a wide region of which the climate is so unvarying, either in its heat or cold. Spitzbergen in summer is very much the same as the mouth of the Mackenzie, and the amenities of a Greenland winter are not strikingly superior to those of Novai Zemlai. A greater expanse of sea in the vicinity may make the cold less severe in the winter, or the heat less intense in the summer; but the Arctic climate is, to a great extent, the same over the whole extent of the frozen regions during the same months in the year. Spring, summer, autumn, and winter there are, as in lower latitudes, but these terms express something different from what we understand by them in more favoured regions. Four months of daylight, four months of darkness, and four months of day and night, might more clearly express the nature of the seasons in the far, far North. The summers are short but bright, and their glory is all the greater after the long dreary winter night of several months. Snow is late in disappearing, and in the highlands and in shady places, except in very warm seasons, remains all the year round. By June, however, summer is upon us in the farthest North. The snow disappears, leaving the bare mossy soil or smooth ice-shaven rocks to make their appearance, in black ever-extending patches, on the white background. The ice has broken up in the fjords; though it remains until late in the summer as a covering to the shallow, dreary little lakes, which the traveller may look down upon in every lonely valley. In the course of a few weeks, the "ice foot" attached to the shore alone remains as the attestation of the wide-spread field of ice which, during the winter months, covers the sea far and wide. The sun by this time has ceased to disappear beneath the horizon at night. Under the continuous daylight every day shows the rapid progress which vegetation is making. By July, every sunny plain is

light with the scant but gay Arctic flora. *Saxifrages* bloom in profusion; the gay *Epilobium* covers the sunny flats among the morasses, and buttercups ornament the

SAMOYEDE FAMILY.

marshy sides of the pools. *Stellaria*, *Oxyria*, and the cotton grass, with its fleecy head of snowy down, show themselves frequently; while in the mossy places here and there *Stellaria Edwardsii* is seen. The yellow poppy, most hardy of Arctic plants, is

CROSSING A HEAVY ICE-PACK AT THE HEAD OF WELLINGTON CHANNEL,
(From an Original Sketch by Commander May, R.N.)

one of the most common flowers, and is soon looked upon by the botanist as one of the most characteristic. The sweet-scented *Hieracium*, which in Iceland is used to scent rooms, and in Greenland to stuff boots with, grows in tufts in every valley, while the springy turf is composed of the spreading crowberry, the dwarf birch, and the blackberry. These plants, as well as the more pleasing scenery, are not the least characteristic feature which liken the region we are describing to the less favoured portions of Orkney, Shetland, or even the highlands of the Scottish mainland. The icebergs, confined during the winter in the frozen fjords, now begin to "shoot out" in long majestic lines, looking like so many silver castles floating in a sun-lit summer sea.

ICE-BAY.

As the season advances, every cliff gets noisy with birds—solemn rotjes, lively dovebies, and the garrulous myriads of mollemoke gulls, which swarm in the sea. The air is alive with the flights of eider (p. 24) and spectacled ducks, and on the rocky islets their nests swarm to such an extent as to allow scarcely foot-room for the traveller who may chance to land on these unfrequented spots. Seals are arriving on the coast in great abundance. Whales are "spouting" far out, or leisurely slumbering on the surface of the quiet bays. White whales and narwhals are making the sea merry with their gambols, and the Eskimo—happy at the thought of endless blubber and a sufficiency of food for the present—considers that the future may look to itself. Even the hungry dogs participate in the abundant feast; though, for the most part, being useless during the period when the ice is off the sea and the snow off the ground, these ravenous beasts of burden are confined on solitary islets to look out for themselves as best they may. On land, the

ravens and hawks, which, with the ptarmigan, form the chief feathered winter residents, are joined by numbers of travellers from more southern lands—birds of passage, which come here to rear their callow young, and disappear again at the approach of winter. During May and June they may be seen flying across the Atlantic, and any ship making for Spitzbergen or Davis' Strait at that season of the year will be sure to be favoured with the visits of snow-buntings and other birds, which alight on the rigging to rest themselves during their long flight. Butterflies and other insects flit about in considerable abundance, and almost every pool is full of specimens of the little *Dytiscus*, or water-beetle, which darts about from side to side among the water-weed stems. The white fox, now in its brown summer coat, is barking its "Aka-ha-ha" from the rock; the quiet glens are full of herds of reindeer; while the Polar bear, lord of all the land, has come out of his winter hibernation, and is ranging sea and land alike in search of his prey. It is the heyday of the short but brilliant Arctic summer. The heat of the sun is intense—beyond what one could suppose from the popular idea of an Arctic climate. So warm is it that mosquitoes, those pests of the Tropics and the North alike, swarm to such an extent, that the tortured wayfarer wearies for a dull day or a cold wintry blast, either of which generally makes them disappear for a time. On one of his summer visits to the Arctic region, so hot was it on land—the sun's rays being broken by no shade of tree or other shelter—that the author preferred to take his excursions by night, and sleep during the heat of a July sun. He would start off about nine or ten at night, and retire at six or seven the next morning. During the whole of that time it was bright daylight. The sun was touching, but had not descended below, the horizon at midnight. But though to all appearance it was day, a "Sabbath silence" in the air told that it was night. Everything was still and quiet; the Eskimo dogs of the little Greenland settlement, which was for the time my temporary home, had ceased from howling. Their masters were at peace among their reindeer skins in the little turf huts I passed; and the very birds seemed to be conscious that this was the fitting season of repose. The mollenokes had flown to the cliffs, or sat on floating pieces of ice, while the rotjes, or little auks, sat in long black lines on the edges of the floes. When, in 1861, in Baffin's Bay, I noticed the same thing; it was only when a whale was killed that they revived, and contended with the sharks for their share of plunder. Such is summer in the far North. It is summer; but the rude wintry blasts that often interchange with the sunshiny days are apt to remind us that the season of darkness, storm, and snow is not far off. In June I have seen a snow-storm, which in a few hours covered the ground to the depth of a foot or more with a white blanket; and often the cold fogs of the evening will render agreeable the furs which the midday heat had compelled the traveller to dispense with in favour of shirt-sleeves and a straw hat. On sea it is generally much more chilly, the absence of radiation from the black rocks and the presence of ice-floes and icebergs, lowering the temperature. Even then it is not uncommon to see the tar on the side of the ship exposed to the sun's rays melting, and the water freezing on the other side in the shade.

The summer, if brilliant, is short; the autumn comes quickly. By August vegetation is on the wane, and before September it has entirely disappeared. A few weeks of

this continuous daylight serve to flower and seed most plants. In the latter month most of the birds of passage have also taken their flight, and the thin "bay ice" is beginning to form in quiet places almost every night. Frequently the ice requires to be broken before the morning ablutions can be performed. Stars appear at night, and with them the Hyperborean summer is at an end. Day and night resume their accustomed alternations of light and dark; sunshine is replaced by mists; and chilly blasts, on which icy snow is borne, warn the navigator either to seek a harbour for the winter, or to sail for more hospitable climates. Navigation, never very safe among the ice-fields of the North, now begins to be absolutely dangerous. During the summer the bergs may be avoided by a skilful steersman, and the floating ice by navigating as far from it as possible. But in the dark autumn nights this is not so easy.

Frequent accidents occur at this time, and the whalers do not attempt, in Davis' Strait and Baffin's Bay, to risk the dangers of floating icebergs at this season. They generally go into some quiet haven, and there (as will be more fully described in a future chapter) patiently await the time when they can take their departure for Dundee or Peterhead. Their boats are sent out in the morning to the mouth of the inlet to watch for whales, and at such seasons storms are not uncommon. Such an occurrence is very graphically described by Mr. Lamont, of Knockdow; and as his words convey more appropriately than I could do the severities of such an autumn storm, I may be allowed to quote the passage from his volume, even though the experience described was observed during the summer and not in autumn:—"The summer gales of Novnia Zemlia may be classified as with or without snow. The former are productive of the most abject state of despair. Only the crew actually engaged on the deck, and the Norseman, who, with his feet in a bag of hay and his beard encrusted with snow, sits like a hoary patriarch at the wheel, need face the snow and sleet which eddy in the wind, and are driven into every corner of the ship. With scarcely a rag of canvas set, we beat uneasily up and down the edge of the ice, or, apprehensive of the drift by leeway and unknown currents, start out through the lugubrious mist to secure an offing. Sometimes the lifting cloud allows us to gaze wearily on the black cliffs, where they run out from the mainland to end in treacherous reefs—on the eternal snows which cover the dreary uplands and ledges of the cliffs—on the dark waters laden with moving masses of ice, or on the fog which hardly allows us to steer clear of them. The damp fog and driving sleet, passing over the deck and rigging, freeze, and leave a glassy, slippery covering on every exposed part—sails, ropes, and spars looking as if wrought in glass. Two inches of ice on the deck, in a continuous slide from the cook's galley to the cabin, sometimes reduces the number of courses at dinner, for the steward is no skilful skater, and the spilled soup freezes with the rest. We make frequent tacks to avoid rocks on the one side, and the grinding stream of eddying icebergs on the other; and at every tack a crisp shower of icicles, printed with the pattern of sails and ropes clattering to the deck, gives the appearance of a recently-demolished glass shop. The noise of floating ice crashing against the bows sometimes culminates in a terrific shock, which makes the ship quiver from stem to stern. The angle at which the ship heels over to leeward renders ordinary occupations impossible,

and, rather than encounter the hazard of tumbling and rolling against each other in the narrow cabin, we sit in well-jammed positions, and spend the time in desultory reading."*

These summer gales, of the kind just described, are most prevalent in the Novaya Zemliian Sea early in May and June, and generally last from sixty to eighty hours. The direction of the wind is commonly from some point between east and west. From the former, it veers through north; and finally, when the gale breaks up, with south-westerly wind, and cirrus and stratus clouds or actual sunshine. During their continuance

SIBERIAN TYPES OF EASTERN ASIA.

the excessive cold, and the difficulties of obtaining the ship's position by observation, are the most serious inconveniences. Mr. Lamont considers that the cause of these gales is to be sought in the difference in pressure between two large atmospheric districts, separated by the mountainous boundary of Novaya Zemlia, nowhere more than sixty miles wide, which difference is modified from time to time by the shifting conditions of ice in the two seas. The temperature of the sea varies according to the amount of ice floating in it, or the fresh water which may be poured into it from the neighbouring rivers. It is rarely much above freezing, though in the localities where the Gulf Stream reaches—viz., to the shores of Spitzbergen, and even to the Kara Sea—the temperature has frequently a considerable elevation. In more favourable autumns, as Professor Nordenskjöld has discovered, the shores of Arctic Asia will be free from ice even as far as the Jenissei River. In April there are sometimes such violent storms that it is impossible for those overtaken by them to keep their feet. Pakhtusof, the Russian explorer, and his companions were, on one occasion, compelled to lie down together with their heads to the wind to avoid being buried, and in this position remained for three

* "Yachting in the Arctic Seas" (1873), p. 43.

days without food. On the east coast wind brings dry weather; but when the Kara gate is open, the same wind brings damp, though this does not reach the west coast. On the latter coast west winds bring damp; and land—i.e., east—winds, always fair weather. When Pakhtusof and Ziwolka were engaged in surveying Novaya Zemlia in 1835, the one would sometimes experience gloomy weather, while the other, on the

SIBERIAN DOG-SLEDGE.

opposite side of the island, had fair. The very day the one could see farthest the other could make no observations.

The effect of floating ice in lowering the temperature, not only of the sea but of the land, is well shown in Iceland. "Iceland" is really a misnomer; for on the isle which the Norse pirate discovered, and which has for ten centuries been the home of the most polished of the Scandinavian race, there is, with the exception of the glaciers in the interior, in reality, little, if any, ice. The harbours are generally open all the year round, and the climate is milder even than the mainland of Norway. The term "Iceland" is only applicable to it in so far that the northern and eastern shores are now and then blocked up with drift ice, which the winds have blown from Greenland. This takes

place, on an average, about once in ten years. In 1883 this was the case, but, fortunately, the ice soon disappeared. It is disastrous to the flocks, in so far that white foxes and Polar bears arrive hungry on the coast; and to the crops, by reason of the fog and chill which fill the air, blighting all vegetation, and reducing the island, for the time being, to the level of Greenland. Though the temperature of different portions of the Arctic regions varies according to locality, and, of course, according to seasons, it may be said to reach sometimes to 70° in the sun, and to average about 45° in the shade. Sometimes, at the height of 3,000 feet in Spitzbergen, the heat derived from the rays of the midnight sun has caused streams of water to issue from the snow, and the temperature, as observed by Scoresby, was 37° Fahrenheit on the 23rd of July. Take, for example, Greenland. In the southern portion of the country the sea is not frozen over in the winter, though encumbered with floating ice derived from the Spitzbergen ice-stream—a current which passes from the vicinity of Spitzbergen down the east coast of Greenland, and upon the west coast to about Holstensbørg, where it exhausts itself. In Smith's Sound the climate is sometimes 60° below zero, and in exceptional years even more severe. Jakobshavn, at the bottom of Disco Bay, may be considered as the mean between these two extremes. Here the mean winter is 3.4° Fahrenheit; the spring, 19.9° ; the summer, 43.1° ; and the autumn, 24.1° . The temperature of the whole year gives the mean of 22.5° —altogether a low temperature, but by no means an extraordinarily severe climate. Certainly that of the winter is not lower than the averages of Upper Canadian winters. The summer, however, is not nearly so warm.

The *Aurora Borealis*—the Northern Lights of the English mariner, the *Nord Lys* of the Danes, and the merry dancers which the Shetland fishermen so well know, as they shoot across the Northern skies—is one of the most familiar sights of the Arctic night. It is seen all the winter through, but it is particularly brilliant in the autumn. It lights the whaler on his joyous voyage home, and gladdens the heart of the explorer in spite of the prospect of the gloomy winter he must face, as he puts his ships in their icy winter quarters. It is a peculiar luminous appearance in the Northern sky—at once one of the most mysterious and most brilliant of spectacles. Its ever-changing and almost fantastic form may be resolved into a dark segment, an arch of light, luminous streamers, and a corona or crown. Probably the darkness of the dark segment is only the contrast with the luminous arch, though this is a question, notwithstanding the numerous observations on the subject which have been published, which is as yet unsettled. The appearance of an aurora, as commonly seen, is shown in our engraving (page 40). The height of the aurora has been variously estimated, but there is good ground for believing that at times it is very near the earth, and even within the region of the clouds; and may even occur during the daylight, though rendered invisible by the sun's brightness. During the prevalence of the aurora, the compass-needle is often much disturbed, showing that magnetism has something to do with it. Very frequently a display of the *Aurora Borealis* is accompanied by a noise, like the rustling of silk, or the whizzing of a multitude of bullets through the air; though this is not invariable. For instance, Sir John Franklin registered 343 displays at Bear Lake without having once heard any sound attend its motions; yet, in the course of five displays

observed within a week in October, 1861, the present writer noted the rustling noise twice very markedly. At the time he was not aware that the same observation had been made by others, and on afterwards reading the remarks of Lieutenant Hood, of Franklin's first expedition, he immediately recognised their accuracy. Though to the lover of nature and the student of science the Northern Light is one of the most interesting of phenomena, yet to the wild Eskimo, and the superstitious walrus-hunters who winter in the North, it is an object of awe. The dogs crouch down behind the rocks, uttering weird low howls, while their masters whisper under their breath that the spirits are fighting in the air. What is the cause of the aurora has not been satisfactorily determined. Probably the explanation of Faraday may be as correct as any other. That eminent physicist demonstrated that the electrical currents which circulate in the globe necessarily tend from the equator to the poles, and has suggested that the aurora may possibly arise from an upward current in the atmosphere flowing back from the poles to the equator. The fact that Sir Leopold McClintock discovered that the aurora appeared to come, not from the fields of ice, but from the surface of open water, favours the idea that it is caused by electrical discharges between the earth and the air, and that these are interrupted by the fields of non-conducting ice. However, no explanation, as yet offered, presents a complete explanation of the varied phenomena of the aurora.

The *mirage*, so familiar a feature of the Eastern deserts, is seen even in the far North. The traveller may see ahead of him an enchanting prospect of reindeer feeding in a valley, and could be certain that his sight was correct, did not they gradually turn into the appearance of "white ponies standing on fine telegraph poles." On approaching, they fade into thin air; but no sooner does the traveller leave the spot, than through the hazy atmosphere they again appear once more feeding in the old place. Mr. Lamont declares that he has noticed the mirage in Novaia Zemlia more marked even than he ever saw it on the hot plains of Africa. On hot sunny days it is remarkable; "vessels (p. 41) or land, which are known to be far out of sight, and, properly speaking, below the horizon, are seen hove up in the air by refraction. The irregular masses of floating ice become dazzling cities, with domes, minarets, and steeples, of a more composite style of architecture than is to be seen in any modern capital; while the floe edge is made to represent magnates of fairy palaces and enchanted castles."

The *winter climate* of the Arctic regions is severe, though generally not more so than that of Upper Canada and some of the Western States of America. The temperature may be low, but if the air be dry and still, the severity of the climate is less felt than even at a higher temperature; but with moisture in the air, an Arctic wind is almost intolerable if it blows over ice-fields, as during the winter it almost invariably does. A "raw" cold, foggy night in England is, by all accounts, more disagreeable than a clear frosty one, 20° below zero, in Upernivik, the most northern Danish settlement in Greenland, and the most northern fixed abode of civilised man in the world. The darkness adds to the gloominess of an Arctic winter. No doubt, the aurora almost every day gilds the snow, and the moon soars clear through the skies, and constellations, unknown to us in these latitudes, sparkle in the Northern sky; but still it is a long night, which ends only after three or four months of darkness. The

Danes in Greenland look upon the winter season as being not the least enjoyable months of their life in that country. During the summer the sea is often clogged with ice, and the bays are full of icebergs, rendering travelling by boat tedious and even dangerous. During the winter, on the contrary, the sea is frozen over, and they move about from settlement to settlement on the swift dog-sledge which skims over the icy surfaces of the fjords and bays in which their little posts are built. It is a season of gossip and

THE AURORA IN THE POLAR BASIN.

pleasantry. The ships have all sailed for Europe; there is little business to do until the ice breaks up in the spring, and amusement is, therefore, the order of the dark winter day. Sometimes the cold is so severe that hoar-frost will be seen on the pillow in the morning, and the rocks will be heard splitting asunder, with loud reports, owing to the expansion of the frozen water in their joints and cracks. Often, even in the North, the ice forms only partially over the sea, and will break up by the storms which, especially in early spring, sweep over the Northern latitudes. Even in the winter, when the sea from one side of Davis' Strait to the other, or from Spitzbergen to Novaia Zemlia and far south of Jan Mayen Island, is one continuous sheet of ice, there are some open places left here and there. At these *ström* holes, or *polynia*, as the Russians

call them—though the latter word has been erroneously applied to the open Polar sea, so called—the white whales and narwhals will often collect in hundreds, struggling to get their heads to the surface to breathe. In April, 1860, a Greenlander was travelling along the ice in the vicinity of Christianshaab, and discovered one of these open “savsats” in the ice. In this hole hundreds of narwhals and white whales were protruding their heads to breathe, no other place presenting itself for miles around. It was described to

EFFECT OF THE MIRAGE.

me as akin to an “Aretic Black Hole of Calcutta,” in the eagerness of the animals to keep at the place. Numbers of Eskimo and Danes resorted thither with their dogs and sledges, and while one shot the animal, another harpooned it to prevent its being pushed aside by the anxious crowd of breakers. Many of the Cetaceans were killed, but many more were lost before they were got home, the ice breaking up soon after (p. 49). In the ensuing summer, the natives found them washed up in the bays and inlets around. Fabricius, the historian of the Greenland fauna, describes a similar scene. In the winter nearly all the Aretic birds have fled, the screech of the hawks and the owl-like croak of the raven being about the only signs of life in the ghastly white flats and fjelds. Every valley is, however, full of ptarmigan, which can be easily killed;

and sometimes, in severe winters, the reindeer will come down almost to the water's edge. One winter in Omasak the natives shot them out of their hut-doors. The white fox occasionally puts in an appearance; and though the bear hibernates, yet sometimes the male may be seen roaming about seeking what he may devour, even in the depth of winter. The fox and the hare alike put on their snowy coats, so as to be almost indistinguishable from the white surface of the ground. The ptarmigan also alters its plumage to white in the winter, as do some other birds to a greater or less extent. The raven, least hypocritical of the feathered inhabitants of the "true and tender North," alone refuses to alter one feather of its black coat to suit the altered circumstances of the season.

The explorers in these latitudes seek winter quarters about October; and as soon as they are secured, dismantle their vessel, and house the deck over with wood-work like the roof of a house, or with canvas, rig up the heating apparatus, *caché* a certain amount of the provisions ashore, in case of an accident happening to the vessel, and if they be of a scientific character, erect an observatory for magnetical or astronomical observations. Want of exercise is the bane of the Arctic winterer. There is no stimulus to move about, and accordingly there is frequently little inclination to do so merely for health's sake. Scurvy soon seizes them, and its ravages have ever contributed to the mortality of Arctic exploration. Salt meat is usually pointed out as the great cause of this disease; this is, no doubt, true, but salt provision does not alone cause it. In South Greenland it is not unfrequent among the Danes. In that section of the "land of desolation" the open sea rarely freezes hard enough for sledging. Snow and sleet are, however, very common. Out-door exercise is all but impossible; and the healthy winter seal-hunting of North Greenland, owing to the absence of sea-ice, can be but little practised. Seal-meat and reindeer are the common articles of food, so that salt cannot be the predisposing cause of the disease, which I am, therefore, inclined to attribute to the want of exercise, combined with the depressing influence of the weather. In North Greenland, during the dark winter, suicide is rather common amongst the Danes. Whatever may be the pleasure of an Arctic winter, the sojourners in Hyperborea hail the return of sun with delight. The Danes in Greenland will climb through the snow to the highest eminence in the vicinity of their houses, in the chance of getting an early peep of it just reddening the horizon, and for a moment gilding the snow. The Siberian Samoyedes and Ostiaks are said to glorify the return of the sun, after the long night of winter, by rejoicing and sacrifices. Eagerly they watch for its appearance, as Dryden has so well described in the oft-quoted lines:—

"In those cold regions, which no summers cheer,
Where brooding darkness covers half the year,
To hollow caves the shivering natives go,
Bears range abroad and hunt in tracks of snow.
But when the tedious twilight wears away,
And stars grow paler at the approach of day,
The longing crowds to frozen mountains run,
Happy who first can see the glimmering sun"

Four months of darkness may be a new negative sensation, but four months of daylight

are decidedly a positive one, and more agreeable. The midnight sun is even a more pleasing object than the Northern Lights. But even after the sun appears summer is afar off. Indeed, some of the most disagreeable weather of the Arctic regions is in early spring. The south-west winds bring snow, of which comparatively little falls during the extreme cold period of winter. In spring, my friend the priest of Egedesminde (page 44) is often blocked into his house between sunrise and sunset; but he is not so badly off as the pastor of a more southern settlement, who is frequently entirely smothered in snow until a gang of men come and shovel him out of his "præstegaard," or parsonage. Rain, or more frequently sleet, is also the concomitant of spring, with wild winds, which carry all before them.

Often the very coldest period of the year is the spring. Sometimes, when the ice-packs split, dense vapours are seen to issue from the fissure, and fall in the form of sharp prickly snow. This frost-smoke is due to the air, not completely saturated, taking up moisture from the water. "The process absorbs and renders latent much heat, and this heat, suddenly taken from the surrounding air, lowers its temperature and causes precipitation." Of much the same nature is the *barber*, as it is called by the whaling sailors. This is the moisture, or fogs in the air, deposited in a fine gossamer netting of sharp spicular icicles, that pierce and excoriate the skin. Often the whole surface of the sea steams like a limekiln with the frost-smoke. The snow which descends is in the form of the most exquisitely shaped crystals, which, owing to the warmer stratum of air into which they descend, can never in our latitude be seen in such perfection.

During the coldest season the sound of voices can be heard much further off than during the warmer weather. The same phenomenon is observable during the winter in our own climate. But in the Arctic regions it is infinitely more marked. "The sound of voices," wrote Parry, "which during cold weather could be heard at a much greater distance than usual, served now and then to break the silence which reigned around us—a silence far different from that peaceable composure which characterises the landscape of a cultivated country; it was the death-like stillness of the most dreary desolation, and the total absence of animal existence." During the winter at Melville Island, people could be heard conversing a mile off—no doubt owing to the density of the cold atmosphere, but also to the absence of all obstruction in the calm air. It may be also remarked that horizontal refraction is increased, owing to the highly-condensed atmosphere, so that the sun becomes visible several days sooner than it ought, by astronomical calculations, to be expected, in the latitude in which the explorers are wintering. The Dutch noticed this when they first wintered in Spitzbergen in 1596. The "*mock*" or "*dog*" *suns* and *moons* are also another common Arctic sight in early spring. By the meteorologist they are better known as *parhelia* and *paraselenæ*, according as it is the sun or moon which is the subject of the optical delusion. They are connected with the halos or circles of prismatic colours around the sun or moon. They are formed from the refraction and "reflection of the rays of light by the minute snow crystals of the cirrus cloud, while coronæ arise from the interference of the rays passing on each side of the globules of vapour." The *parhelia* and *paraselenæ* are the images of the sun or moon, which generally appear at the points of intersection

of the circles of the halo, owing to the light concentrated at these points. These images also exhibit the prismatic colours of the halo.

Glories of Light, or *anthelia*, are also seen in the Arctic regions in great perfection. They are sometimes seen when the shadow of an observer is lost in fog, and the shadow of his head is surrounded with prismatic circles (Buchan). Scoresby, on one occasion, saw four concentric circles around his shadow. The phenomenon is always seen in the Polar regions when sunshine and fog occur at the same time.

WINTER VIEW OF EGEDSMUNDI (EGEDE'S MEMORY), NORTH GREENLAND. (From an Original Sketch by Mr. A. P. Tegner.)

When the darkness disappears the snow and ice begin to melt rapidly. But through the whole summer, pieces both of sea and glacial ice are floating in the sea. The latter is, of course, continually being discharged from the land, and the summer has no effect on its production. On the contrary, the icebergs shoot out with renewed vigour during the summer months. The soil is always frozen to a considerable depth until late in the summer; in some places it never thaws beyond a few feet in depth. At Jakutsk, in Siberia, frozen soil was found, on digging a well, at the depth of 382 feet below the surface. In January, 1853, Sir Edward Belcher experienced at his winter quarters in Wellington Channel a temperature as low as 66° below zero of Fahrenheit.*

* In a popular work of this kind it would be more weariness to the reader to go elaborately into the question of recorded temperatures. Those, however, who are interested in it will find much information on the subject in the Admiralty's "Manual and Instructions for the Arctic Expedition of 1875," and in the works there quoted.

"THE OPEN POLAR SEA."

It may be reasonably believed that the further one goes northward, the more severe will be the climate. This is the almost universal opinion of those who have explored the North. I am not at present aware of a single whaler who has any other opinion; and I may mention that one of the most experienced and far-sighted of the amateur explorers of the Arctic Sea—Mr. Lamont—is of the same belief. However, a

KANE AND HIS COMPANIONS IN WINTER QUARTERS IN SMITH'S SOUND.

contrary view has been long held by theorists, and by a few explorers like Kane and Hayes. Though analogy militates against the likelihood of this idea, yet again and again the captivating tale is told that, in the far, far North, the waters around the Pole are comparatively free from ice, and that yet a ship may sail in that "open Polar sea" refulgent in Northern sunshine. In this favoured Eden of the Polar sea, kindly dreamers have persuaded themselves that no longer will the explorer's path be barred by those

"Mountains of ice that stop the imagined way
Beyond Petsora easterly, to the rich
Cuthaina coast."

Again and again have these open places been reported; but repeatedly have they proved to be only local and of limited extent. However, as the doctrine, until it has been absolutely disproved, will be again and again broached, we may briefly summarise the arguments which have been adduced in support of this view. At the same time, they illustrate the arguments brought against it with more soundness. It is pointed out, for instance, that the enormous majority of the bergs drift south, while, if there were a warm current running north, the contrary would be the case. It is deemed by those not in favour of the theory of an open Polar sea, that the fact of birds seen flying northward is a proof of a milder climate around the Pole. Ptarmigan are continually killed during the winter in high Northern latitudes; dovekies (*Uria grylle*) and other water-fowl stay all the winter in the open leads among the ice. The knot (*Tringa canutus*) goes to the Arctic regions to breed, but hitherto its nest has never been found. These and other birds seen flying northwards at this season of the year—the spring—are migratory birds, which leave warmer countries to rear their young in the Arctic regions, and therefore cannot properly be said to be flying north to seek a milder climate. Morton, Dr. Kane's steward, reported having seen "seals sporting and water-fowl breeding in the 'open sea' he saw from Cape Jefferson;" but the same might be seen in any part of the Arctic Sea where there was open water. Dr. Rink has, moreover, conclusively proved that the famous "open Polar sea" of Morton was merely a channel cut by the strong current during the warm days of midsummer, and the explorations of Hall and Nares have proved that it was only a "bight" in the sound stretching still further towards the Pole. The great number of seals and sea-fowl seen by Morton, so far from being conclusive proof of an open Polar sea, is viewed by the eminent authority quoted as merely a sign of a single opening in the sea, the rest of which was covered by ice—sea-birds and other animals always flocking together in such places. Dr. Hayes' open sea comes under exactly the same category. Hayes was, however, able to support his party on reindeer in the very district where Kane, with the assistance of experienced hunters, all but starved. Indeed, had it not been for the Etah Eskimo, he must have inevitably succumbed, with all his party. It is, therefore, untrue that, as Maury asserts, he was able to subsist his party "on the shores of an ice-bound sea." Even the natives—iron men though they be—had in the month of March been compelled to eat twenty-six out of thirty of their dogs; and poor Hans Heindrick, who, all for the love of Shaghu's pretty daughter, had deserted Kane, and preferred to remain behind, had been forced to eat the sealskin which covered the frame of his *kayak*. It is also a curious fact that the coldest mean temperature for the summer months were those of Kane, Hall, and Nares, the three winter quarters nearest to the mythical open sea.

Wrangell, speaking of the supposed open sea north of Siberia, mentions that the north-west winds brought with them a thick, moist fog, so that clothes and tents were wet through. The contrary was true as regarded Smith's Sound. The winds from the supposed open sea were always the coldest, while the south-east winds were moist. The seasons at which the open sea described by Penny and Morton was seen, only shows that local causes produced an earlier disruption of the ice than elsewhere; and finally, the opponents of the "open Polar sea" theory argue that the drifts of the *Advance*,

Resolute, and *For*, were owing to causes unconcerned with any movements of ice in the Polar basin. Last of all, it is not very charitably concluded by certain navigators, whose opinion may be taken for what it is worth, that the "open Polar sea" of Kane and Hayes in Smith's Sound was "discovered" there merely as something "to work expeditious to," and to cover the failure of the main objects of the expedition—just as the English had formerly put a "polynia" up Wellington Channel. However, in latitude $83^{\circ} 20' 26''$, 399½ miles from the North Pole, Markham found only firm "ancient" ice.

The idea of open water around the Pole is, nevertheless, a sufficiently old one, and was talked of as a scientific problem long before the expeditions mentioned were first proposed. Thus the illustrious Sir David Brewster pointed out, as far back as 1821, that distance from the Equator was not to be taken as an accurate measure of heat and cold, and that, in all probability, the thermometer would be found to range ten degrees higher at the Pole than in some other parts of the Arctic regions. Scoresby also showed that, owing to the long-continued sunlight of six months, which must prevail at the Pole, theoretically, at the summer solstice, the influence of the sun on the surface of the earth is greater at the Pole than at the Equator, by nearly one-half. That in reality, however, this is erroneous, is shown by the fact that in latitude 78° N., on the same basis of calculation, the influence of the sun is only $\frac{1}{4}$ th less than at the Pole, and also much greater than at the Equator. Now in latitude 78° N. the mean temperature of the year is 17° Fahrenheit, and ice is formed during nine months in the Spitzbergen seas, neither calm weather nor proximity to land being essential to its formation.*

Scoresby, however, though theoretically holding the opinions he did, was, like most other whalers, one of the strongest opponents of the idea of an "open Polar sea." A later advocacy of the "open Polar sea" has been founded on the supposed fact that no icebergs or ice, encumbered with earth or stones, have been seen floating south from the supposed site of that region into the early explored parallels. But this idea has been at once exploded by the fact that the Swedish Expedition, which in 1868 attempted this northward route, met with stones and earth on the ice which was drifting south, showing that they had been attached to some land between Spitzbergen and the Pole, and that this area was frozen. Parry also found sand on the ice in latitude 82° N. We may therefore justly conclude, in the words of Professor Nordenskjöld, that the idea of an open Polar sea "is evidently a mere hypothesis, destitute of all foundation in the experience which has already, by a considerable sacrifice, been gained; and the only way to approach the Pole which can be attempted, with any probability of succeeding, is that proposed by the most celebrated Arctic authorities of England," viz., that of—after having passed the winter at the Seven Islands, at Franz Josef's Land, or at Smith's Sound—continuing the journey towards the North on sledges in the spring.†

CHAPTER III.

SEA ICE, GLACIERS, AND ICEBERGS.

THE ice we see floating about in the Arctic Sea during the summer is of two kinds—the product of the freezing of the sea, and that derived from the glaciers, and, therefore, fresh water and of the land. The first is generally in the form of cakes of all sizes, from pieces a few inches in diameter to many miles in area. These *fields* of ice—a name applied to a continued sheet of ice, so large that its boundaries cannot be seen from the mast-head—are the remains of the broken-up *floes* of the winter. This leads us to speak of the various terms applied to Arctic ice, as these phrases continually occur on a voyage, often with but a vague meaning attached to them.* Some of the large ice-fields are frequently more than a hundred miles in length, and more than half of that in breadth, each consisting of a single sheet of ice, having its surface raised generally about four or six feet above the level of the water, and its base depressed to the depth of nearly twenty feet beneath. Yet the thickest and strongest of these ice-fields cannot resist the power of a heavy swell. Indeed, the thickest fields are more apt to be broken up by the force of the pressure and the currents than the thinner and more pliable ice. When such a field is driven to the southward, and becomes exposed to the effects of a *grown* or *ground* swell, it presently breaks into a great many pieces, few of them exceeding forty or fifty yards in diameter. When these pieces get together, navigators speak of them as the packed ice, or the *pack*. This pack is the ice into which ships are frequently embedded, and is often so large that it extends on every side so far that the eye can only detect the water, in the form of *lanes* or *leads*, intersecting it. To navigate these *leads* is the duty of the captain, who sits in the cask or crow's-nest at the mast-head. All around is the white snow-covered pack, relieved only by the black water. It seems as if we were threading roads running through a snow-covered plain (p. 52). When the pack is so circumscribed that it can be seen across, it is known as a *patch*, and is called a *stream* when its shape is more of an oblong, no matter how narrow it may be, “provided the continuity of the pieces is preserved.” A *floe* is usually the term applied to pieces smaller than fields; and *brush ice* to the pieces which break off, and are separated from the longer masses by the effect of attrition. These pieces are often collected into streams and patches. *Drift ice*, or *loose* or *open ice*, is ice so open that ships can sail through it. Frequently, even in the depth of winter, the fields of ice, after being squeezed on one another, are set on edge, and in that position cemented by the frost. Such eminences in the midst of an ice-field are called *hummocks*; and ice in which they are of frequent occurrence hummock ice.

Hummocks are also caused by pieces of ice mutually crumpling each other, the wreck being

* Scoresby, on the “Greenland or Polar Ice” in “Memoirs of the Wernerian Society,” 1815, p. 261; also “Arctic Regions,” &c.

BREAKING-UP OF AN ICE-FIELD.

tumbled about in such a manner as to give that variety of fanciful shape and picturesque appearance which any view of Arctic ice (p. 49) will immediately convey an idea of to the reader. Hummocks often exceed the height of thirty feet. A *calf* is a portion of ice which has been depressed by the same means as a hummock is elevated. It is kept down by some larger mass, from beneath which it shows itself on one side. Dr. Scoresby mentions that in his voyages as a whaling captain he has seen a calf so deep and broad that the ship sailed over it without touching, when it might be observed on both sides of the vessel at the same time. This, however, is attended with considerable danger, and necessity alone warrants the experiment, as *calves* have not unfrequently (by a ship touching them, or disturbing the sea near them) been called from their submarine situation to the surface, with such accelerated velocity as to stave the planks and timbers of the ship, and in some instances to reduce the vessel to a wreck. A "calf" is the name sometimes also applied to the pieces which break off from icebergs. Any part of the upper surface of a piece of ice which projects from the parent mass midst the water is called a *tongue*. A *bight*, or *bay*, is a sinuosity in the ice-field, in which sailing vessels, by a sudden change of wind, have been frequently wrecked.

The temperature at which sea water freezes depends not a little on the amount of fresh water, derived from rain, snow, or melting ice, which is mixed with it. It is usually given at 28.5° ; but it varies, according to the conditions mentioned, from that figure up to 31° . We must also remember that salt water, *per se*, does not even freeze at these temperatures. When the sea freezes the greatest part of the salt which it contains is deposited, and the frozen spongy mass probably contains no salt but what is natural to the sea water filling its pores. The first, or *bay ice*, is almost fresh, though in some cases, independently of the power of cold in precipitating salt, it is really composed of the surface fresh water. Salt water and sea ice is porous, white, and for the most part opaque. Yet the rays of light pass through it with a greenish shade. It swims lighter than fresh-water ice. In its pores will frequently be found highly concentrated salt water, or salt in the solid form, "either as a single crystalline substance, or as a mixture of ice and salt crystals."* When salt-water ice floats in the sea at a freezing temperature, the proportion above to that below is as nearly one to four. In fresh water at the freezing-point it is nearly one to seven. Iceberg ice forms the bulk of the fresh-water ice which floats in the Arctic Seas. It is mostly derived from the land glaciers, though some of it is poured out of the great rivers which debouch into the Arctic Ocean, at the North of Europe, Asia, and America. It is fragile and hard, and the most homogeneous and transparent pieces are capable of concentrating the rays of the sun, so as to produce a considerable intensity of heat. "With a lump of ice, of by no means regular convexity, I have frequently burnt wood, fired gunpowder, melted lead, or lit the sailors' pipes, to their great astonishment; all of whom who could procure the needful articles eagerly flocked around me for the satisfaction of smoking a pipe ignited by such extraordinary means. Their astonishment was increased on observing that the ice remained firm and pellucid, whilst the solar rays emerging therefrom were so hot that the hand could not

* Buchanan, "Proceedings of the Royal Society," vol. xxii., p. 341.

be kept longer in the focus than for the space of a few seconds. In the formation of these lenses I roughed them with a small axe, which cut the ice tolerably smooth. I then scraped them with a knife, and polished them merely by the warmth of the hand, supporting them during the operation in a wooden glove. I once procured a piece of the purest ice, so large that a lens of sixteen inches diameter was obtained out of it. Unfortunately, however, the sun became obscured before it was completed, and never made its appearance again for a fortnight, during which time, the air being mild, the lens was spoiled."

Land supplies no aid to the freezing of the sea, nor is the vicinity of any land necessary. A rough sea will even freeze if the cold be sufficient. The crystals are then in the form of what the sailors call *sludge*, and look as if a shower of snow had fallen on the surface. The effect of these crystals forming, as if oil had been cast on the sea, is that they still its breaking surface. Soon a continuous sheet is formed, but by the action of the waves this sheet is broken into smaller pieces, about three inches in diameter. By attrition the corners are worn off, and look not unlike what they are called—*pancakes*. Several of these unite and continue to increase, until they become a foot or so in thickness, and many yards in circumference. This is known as *pancake ice*. It is the ice most usually seen when reaching the Arctic Sea south of Jan Mayen in March and April. It was the first form of Polar ice which the writer saw in the spring of 1861, when cruising in that vicinity. In smooth water freezing is accomplished even more early. It commences in the same way; and in the course of a couple of days a sheet is formed capable of supporting a man. This is known as *bay ice*, from usually forming in the quiet bays. The old ice of last year's growth is known as light and heavy ice, and is, according as it forms, a foot to three feet in thickness, and upwards. This kind of ice not only forms in quiet harbours, but in every opening in the ice even at a great distance from land. In these localities the surface is usually as smooth as that of a harbour. Bay ice is the familiar night warning which the Arctic navigator receives in the autumn that the winter is coming on. As it forms around his ship, if he is prudent, he will steer for a more open sea and a milder climate, or seek a more secure shelter than the "high seas." The falling snow freezes along with the ice, and assists in giving it thickness. Indeed, there is no field of ice of which the upper portion is not composed of snow, and in most cases is hardly distinguishable from it.

The formation of fields of ice, by the breaking up of these continuous sheets in the spring, I have already spoken of. Ice-fields are powerful physical agents. It is to them that most of the accidents to Arctic-going ships are due. Many of these fields cannot be less than ten thousand million tons in weight; and in addition to the force exercised by both bodies of this magnitude coming against a vessel, these ice-fields often acquire a great velocity. A field thus in motion coming in contact with another produces a dreadful shock. If a ship intervenes, then nothing can save the stoutest vessel that ever was built. When we speak of a whaling voyage (Chapter.V.), we may have occasion to describe these accidents more fully. In the meantime, the reader can imagine how powerful for evil these ice-fields are. At the same time, though they destroy the ship, they save the sailors, who, by leaping on the floating ice, save themselves from the death which they would otherwise

inevitably meet. Even a ship "beset" is momentarily subject to the risk of being destroyed. The stoutest ship's ribs can no more withstand the shock of two of these ice-fields, even a couple of feet in thickness, than a sheet of paper could withstand the blow of a pistol-ball. The cause of the motion of the ice may be due to currents, the wind, or the pressure of other ice against them.

IN A "LEAD" IN AN ARCTIC ICE-FIELD.

GLACIERS.*

In our latitudes, and at low elevations, all the snow which falls during the winter melts off during the heat of the ensuing summer. As we ascend higher and higher, this winter's snow takes a longer period to disappear, until, at a certain elevation, a portion always remains over to be carried to the account of next winter's fall. The line above which the winter's snow is not melted off by the summer's heat is known as the "snow-line." The height of this snow-line varies according to the season, the side of the mountain, and the distance of the mountain from the poles. For instance, if the mountain be not far from the equator, the snow-line will be at a great elevation; if it be near the north or south

* In the following account the description of Arctic glaciers is, to some extent, abridged from a paper drawn up by me, at the request of the Royal Geographical Society, for the use of the Arctic Expedition of 1875: "Arctic Papers of the Royal Geographical Society," pp. 1—74.

Poles, it will be almost at the sea-level. In the Himalayas it is at a height of 14,000 or 15,000 feet; in Spitzbergen and Greenland, as we shall presently see, there are perpetual snow and ice at a very few feet above the shore. If this accumulation of snow continued to gather and gather above the snow-line, the result would be that the top of the mountain would get like a white umbrella, or like a monster snow-covered mushroom. Of course this would be

THE GLACIER OF HÜHNERBERG, EAST GREENLAND.

impossible—the laws of physics forbid it. The mountain-top, therefore, relieves itself of part of its load by allowing it to glide down into the valley below. This constitutes the “awful avalanche” which is so familiar to Alpine dwellers. The great mass of snow slowly slides down at first, quickly gathering speed, until it assumes an immense velocity, carrying along with it in its course trees, stones, and even large rocks, which may happen to lie in its path, until it comes into the region of habitable country. Here the buried traveller and the ruined shepherd’s *châlet* give only too vivid evidence of the force of the avalanche.

There is, however, another and more important method in which the mountain relieves itself of the load of perpetual unmelting snow. This is by means of the *glacier*, a French

word, which means literally the ice-maker, though it is now thoroughly naturalised in English. The glacier commences just at that point where the snow is alternately melting during the day and freezing during the night. This is at the termination of the line of perpetual snow—at the snow-line in fact. All above this point is known as the *névé*, a Swiss provincial word, which has also got incorporated into our vocabulary. By this alternate melting and freezing, and by the pressure of the snow-masses on each, the snow gets converted into a dull white, semi-porous ice. This ice begins to move downward—to seek the lowest elevation. It is the commencement of the glacier. The glacier is now continually on the move, impelled by what force is not yet clearly made out. Numerous theories have been suggested, though in many cases the cause which impels the glacier to move, and the method by which an icy river-like mass moves, have been mixed up together. Saussure, Charpentier, Agassiz, Forbes, Mozley, and Tyndall may be cited as among the authors of the theories of glacier motion. Amid their war of words it will be sufficiently safe for us to take refuge in the old theory advanced by the first climber of Mont Blanc—De Saussure—that a glacier moves down the mountain-side simply because it cannot do anything else, owing to the pressure of the ice and snow in its rear. Certain it is that it moves slowly but surely, until it fills the valley, be it broad or narrow; and, still moving onward, unites with other tributary glaciers, just as a river unites with tributary streams, to swell into one broad current of ice. The rate at which it moves varies according to the season of the year, the part of the world, and the position of the glacier, which is taken into consideration. In the Alps the average rate is from $6\frac{1}{2}$ to $19\frac{1}{2}$ inches daily. The sides move more slowly than the centre, where the maximum rate is $23\frac{1}{2}$ to $33\frac{1}{2}$ inches per diem. Again, the bottom of the glacier, being retarded by the ground over which it passes, moves more slowly than the top. The motion of the glacier is, in reality, to all intents and purposes, subject to the same laws as the motion of a river. The Arctic glaciers, of which we shall presently speak, move much more slowly. From four and a half to eight inches per day is the rate at which the Greenland glaciers have been observed to move.

The appearance of a glacier after it has travelled several miles and acquired its normal force is that of a ridged expanse of snow-covered surface. The whole is broken up by deep cracks or *crevasses*, great rents down which the streams formed by the melting of the snow tumble with a hollow sound; *glacier tables*, formed by the melting of the glacier all around the ice, protected by flat stones which have fallen on it, until they are supported by icy pillars; ice cones, formed in much the same way where sand has fallen; *moulins*, or hollow funnel-like places worn by the streams which leap into them with a noise like thunder; and *moraines*. Of these the moraines are most remarkable. They are simply the stones, earth, and other *débris* dislodged from the sides of glaciers, and which accordingly lie on them in long lines on each side. These are the *lateral moraines*. If the glacier unite with a second, the contiguous lateral moraines will form a single *medial* one down the middle of the common glacier, while the lateral ones remain as before, and so on. In this way the ever-moving glacier will carry rocks from the high Alps far down into the plains below—miles and miles, it may be, from their original home. From under the glacier is water ever flowing—sometimes a tiny stream, at other times a considerable river. The Rhône and other rivers take their rise in these sub-glacier streams. These streams are formed by the melting

of the under surface of the glacier, which is at a higher temperature than the upper surface, and by the surface rivulets, which pour down the crevasses and moulin (or "mills"). The glacier in moving along embeds in its under-surface stones, earth, and other *débris* which it passes over. It thus acts like a huge movable file on the rocks with which it comes in contact. The result is that the sub-glacier river is laden with a white impalpable mud, and that the rocks over which a glacier has gone are rounded and grooved, and the whole country shaven as if by a rough plane and file combined. The Swiss shepherds know this well, and style such rounded rocks *roches moutonnées*, from their likeness to the backs of black sheep lying in the long grass. The glacier is all the time moving from the frosty summit of the lofty peak down into the lowland valley. If the season be a favourable one among the vineyards and corn-fields, it stops there; and the heat of the sun being more powerful than the propelling motion of the glacier, causes the end to melt away, and the progress of the great ice-river is thus terminated. Standing in front of one of these glacier ends, a sloping mass of ice faces the observer. Water is streaming over the edge, and the white muddy glacier river is pouring out from beneath. Over the edge of the glacier something is always tumbling—at one time a thimbleful of sand, at another a cartload of rock and earth. If the glacier has retreated, as sometimes it will during hot summer, this rubbish will extend across the glen parallel with the end of the glacier, like a confused rampart, under the name of the *terminal moraine*. These moraines, along with the rock-scratchings and *roches moutonnées*, are the certain signs of glaciers having passed over those parts of the country, and, as we shall see presently, are adduced as proof that the Scottish glens were once the beds of glaciers, like those of the Alps, or of Greenland, in an earlier stage of the world's history.

Sometimes a glacier will move much farther than was expected, and advance far into the region of cultivated land, killing the crops and carrying away cottages and other obstacles in its way as easily and much more certainly than the carpenter's plane carries the shavings of the plank before it. This is, however, rarely met with. Long after it has retreated it leaves behind it the marks of its visits—such as angular blocks of stone which it has carried on its surface, often belonging to rock not found in that vicinity, moraines, scratched and polished stones, *roches moutonnées*, and boulders rounded by being rolled under the glacier into the under surface, where they have got embedded. These "foundlings," as they are called in Switzerland (page 56), are found plentifully scattered over every Alpine valley, in places where no glaciers have ever been since the memory of man.

Such is a brief sketch of some of the more common phenomena of glaciers. They are the same whether in the Alps of Norway or of New Zealand, in Switzerland, or in the Himalayas. Hitherto we have avoided the disputed question of the cause of glacier motion. To explain this many theories have been advanced, some of which are almost entirely abandoned; others are still *sub judice*. Among these must be taken the theory of Forbes, who looks upon a glacier as an "imperfect fluid or viscous body which is urged down slopes of a certain inclination by the mutual pressure of its parts." According to this eminent Alpine observer, a glacier is not a crystalline solid, like ice, frozen in

a mould, but possessed of "a peculiar fissured and laminated structure, through which water entered into its intrinsic composition, giving it a viscid consistence similar to that possessed by treacle, honey, or tar, but differing in degree." Tyndall's theory is in reality very little different from that of Forbes, only he denies that glacier ice is viscid, but that its motion is due to the alternate fracture and re-freezing (or re-gelation, as he calls it) of the broken fragments. A hot war has been the result of this glacier discussion, in which the rival combatants have used terms and thrown out insinuations against each

ICE-BORNE BLOCK OF STONE, KNOWN AS "A FOUNDLING," IN SWITZERLAND.

other of a nature, no doubt, characteristic enough of scientific controversy, but which are decidedly unworthy of the dispute and the disputants.

ARCTIC GLACIATION.

In the Polar regions there are also glaciers identical with those of Alpine countries, but on a grander scale, and in some respects different from those of inland countries, owing to their proximity to the sea. In the Arctic regions the snow-line is close to the water's edge—at most only a few hundred feet above it. The glaciers thus, sooner or later, reach the sea, which they can never do in the Alps, though in Norway some of them do. When they reach the sea they break off in the form of icebergs, so familiar to the voyager in the Arctic Ocean. In Spitzbergen and in Greenland they are seen in perfection; but it

is only in the latter country that Arctic glaciation can be seen on a great scale. Hence we may take Greenland as typical of the rest of the Arctic regions.

Greenland is in all likelihood a large wedge-shaped island, or series of islands, surrounded by the icy Polar basin on its northern shores, and with Smith's Sound, Baffin's Bay, Davis' Strait, and the Spitzbergen or Greenland Sea of the Dutch—the old "Greenland Sea" of the English whalers—completing its insularity on its western and eastern sides. The whole of the real *de facto* land of this great island consists, then, of a circle of islets, of greater or less extent, circling round the coast, and acting as the shores of a great interior *mer*

THE BRØNNE GLACIER.

de glace—a huge inland sea of fresh-water ice, or glacier, which covers the whole extent of the country to an unknown depth. Beneath this icy covering must lie the original bare ice-covered country, at a much lower elevation than the surrounding circle of islands. These islands are bare, bleak, and more or less mountainous, reaching to about 2,000 feet; the snow clears off, leaving room for vegetation to burst out during the short Arctic summer. The breadth of this outskirting land varies, as do the spaces between the different islands. These inlets between the islands constitute the fjords of Greenland, and are the channels through which the overflow of the interior ice discharges itself. It is on these islands, or outskirting land, that the population of Greenland lives and the Danish trading-posts are built—all the rest of the country, with the exception of this island circle, being an icy, landless, sea-like waste of glacier, which can be seen here and there peeping out in the distance. On some of the large and more mountainous islands, as might be expected

in such a climate, there are small independent glaciers, in many cases coming down to the sea, and there discharging icebergs; but these glaciers are of little importance, and have no connection with the great internal ice-covering of the country. I have called the land encircling this interior ice-desert "a series of islands," because though numbers of them are joined together by glaciers, and only a few are wholly insulated by water, many of them (indeed, the majority) are bounded on their eastern side by this internal inland ice; yet, whether bounded by water or by ice, the boundary is perpetual, and whatever be the insulating medium, they are to all intents and purposes *islands*. This is well known to the Danes in Greenland by the name of the "inlandsis," and though a familiar subject of talk amongst them from the earliest times, it is only a very few of the "colonists" who have ever reached it. The natives everywhere have a great horror of penetrating into the interior, not only on account of the dangers of ice-travel, but from a superstitious notion that the interior is inhabited by evil spirits in the shape of all sorts of monsters.

Crossing over the comparatively narrow strip of land, the traveller comes to this great inland ice. If the termination of it be at the sea, its face looks like a broken ice-wall: indeed, the Eskimo called it the *Sermik soak*, which means this exactly. The height of this icy face varies according to the depth of the valley or fjord which it fills. If the valley be shallow, the height is low; if, on the contrary, it be a deep glen, then the sea-face of the glacier in the fjord is lofty. From 1,000 to 3,000 feet is not uncommon. In such situations the face is always steep, because bergs are continually breaking off from it; and then it is not only extremely dangerous to approach it, on account of the ice falling, or the wave caused by the displacement of the water, but from the great steepness of the face it is rarely possible to get on to it at all. In such places Dr. Rink has generally found that it rises by a gradual slope to the general level plateau beyond. However, where it does not reach the sea, it is often possible to climb on it from the land by a gentle slope, or even in some cases to step up on it as it shelves up. Once fairly on the inland ice, a dreary scene meets the view. As far as the eye can reach, to the north and to the south, is this same great ice-field, the only thing to relieve the eye being the winding black circuit of the coast-line land or islands before described, here infringing in little peninsulas on the ice, there the ice dovetailing in the form of a glacier on the land, and now and then the waters of a deep fjord penetrating into the ice-field, its circuit marked by the black line of coast surrounding it on either side, the eastern generally being the ice-wall of the glacier, the western being the sea. Travelling a short distance on this interior ice, it seems as if we were travelling on the sea. The land begins to fade away behind us like the shore receding as we sail out to sea; while far away to the eastward nought can be seen but a dim, clear outline like the horizon bounding our view. The ice rises by a gentle slope, the gradient being steeper at first, but gradually getting almost imperceptible, though real. In the winter and spring this ice-field must be covered with a deep blanket of snow, and the surface must then be smooth as a snow-covered frozen lake; but in the summer, by the melting of the snow, it is covered with pools and coursing streams of icy-cold water, which either find their way over the edge, or tumble with a hollow sound through the deep crevasses in the ice. How deep these crevasses are it is impossible to say, as we could not see to the bottom of them, nor did the sounding-cord reach down except a short way. The depth of the ice-covering will.

of course, vary; when it lies over a valley it will be deeper, over a mountain-top less. All we know is, that just now it is almost level throughout, hill and dale making no difference. However, with such a huge superincumbent mass of ice, the average height of the coast-lying islands is greater than that of the inland ice, and it is only after climbing considerable heights that it can be seen.* Therefore, supposing this covering to be removed, I think the country would look like a huge shallow oblong vessel with high walls around it. The surface of the ice is ridged and furrowed after the manner of glaciers generally; and this furrowing does not decrease as we go further inland, but, as far as our limited means of observation go, it seems to increase; so that were it possible to cross this vast icy desert on dog-sledges when the snow is on the ground, I do not think it would be possible to return, and its exploration would require the aid of a ship on the other side. On its surface there appears not a trace of any living thing except a minute alga (a simple, almost microscopic plant); and after leaving the little outpouring offshoot of a glacier from it, the dreariness of the scene is not relieved by even the sight of a patch of earth, a stone, or aught belonging to the world we seem to have left behind. Once, and only once, during our attempt to explore this waste did I see a faint red streak, which showed the existence of the red snow-plant; but even this was before the land had been fairly left. A few traces of other algae were seen by Professor Nordenskjöld and Dr. Berggren, who (in 1870) made a similar but more successful attempt. Animal life seems to have left the vicinity; and the chilliness of the afternoon breeze, which regularly blew with piercing bitterness over the ice-wastes, caused even the Eskimo dogs to crouch under the lee of the sledge, and made us, their masters, draw the fur hoods of our coats higher about our ears.† Whether this ice-field be continuous from north to south it is not possible in the present state of our knowledge to decide, but most likely it is so. Whether its longitudinal range be continuous is more difficult to decide, though the explorers who have attempted to penetrate it, saw nothing to the eastward to break their view; so that, as I shall immediately discuss, there seems every probability that in Greenland there is one continuous unbroken level field of ice, swaddling up in its snowy winding-sheet hill and valley, without a single break for upwards of 1,200 miles‡ of latitude, and an average of 400 miles of longitude, or from Cape Farewell to the upper extremity of Smith's Sound, and from the west coast of Greenland to the east coast of the same country, a stretch of ice-covered country infinitely greater than ever was demanded hypothetically by Agassiz in support of his glacier-theory.

Are there any ranges of mountains from the slopes of which this great interior ice descends? As I have said, we are not in a position to absolutely decide; but the probabilities are in favour of the negative. There are no iceberg "streams" on the east coast of Greenland, and bergs are rare off that coast. If there were many icebergs, the field of floe

* In Rink's "Grönland," ii., p. 2, are two characteristic views of the appearance of the interior ice seen from such elevations; also in "Meddelelser om Grönland," Heft i., Plates 1, 2.

† For description of the effects of the ice in limiting animal and vegetable life, *vide* the author's "Mammalian Fauna of Greenland," "Proc. Zool. Soc. Lond., 1868," p. 337; Admiralty's "Manual of the Natural History of Greenland," 1875, p. 7; and "Florula Discoana," "Trans. Bot. Soc. Edin." vol. ix., p. 440.

‡ Rink says 800 miles; but throughout his valuable works he speaks only of the Danish portion of Greenland, of which it professes solely to be a description. Jamieson and others seem to think that it is only North Greenland that is covered. All the country, north and south, is equally swathed in ice, except where the "Nunataks" protrude.

and pack-ice which skirts that coast, and which has prevented exploration except in very open seasons, would soon be broken up by the force with which the bergs, breaking off from the land, would smash through the icefield, and, acting as sails, help, by the aid of the winds, as elsewhere, to sweep it away. I am therefore of opinion that the great ice-field slopes from the east to the west coast of Greenland, and that any bergs which may be seen on that coast are from local glaciers, or from some unimportant defluent of the great interior ice. Nor do I think a range of mountains at all necessary for the formation of this huge *mer de glace*; for this is an idea wholly derived from the Alpine and other mountain ranges, where the glacier system is a petty affair compared with that of Greenland. I look upon Greenland and its interior ice-field in the light of a broad-lipped, shallow vessel, but with chinks in the lips here and there, and the glacier like the viscous matter in it. As more is poured in the viscous matter will run over the edges, naturally taking the line of the chinks as its line of outflow. The broad lips of the vessel, in my homely simile, are the outlying islands, or "outskirts;" the viscous matter in the vessel the inland ice, the additional matter continually being poured in in the form of the enormous snow covering which, winter after winter, for seven or eight months in the year, falls almost continuously on it; the chinks are the fjords or valleys down which the glaciers, representing the outflowing viscous matter, empty the surplus of the vessel. In other words, the ice flows out in glaciers, overflows the land, in fact, down the valleys and fjords of Greenland, by force of the superincumbent weight of the snow, just as does the grain on the floor of a barn (as admirably described by Jamieson) when another sackful is emptied on the top of the mound already on the floor. "The floor is flat, and therefore does not conduct the grain in any direction; the outward motion is due to the pressure of the particles of grain on one another; and, given a floor of infinite extension, and a pile of sufficient amount, the mass would move outward to any distance, and with a very slight pitch or slope it would slide forward along the incline." To this let me add that if the floor on the margin of the heap of grain was undulating, the stream of grain would take the course of such undulations. The want, therefore, of much slope in a country, and the absence of any great mountain-range, are of very little moment "to the movement of land-ice, *provided we have snow enough*."

As the ice reaches the coast it naturally takes the lowest level. Accordingly, it there forks out into glaciers or ice-rivers, by which means the overflow of this great ice-lake is sent off to the sea. The length and breadth of these glaciers vary according to the breadth or length of the interspace between the islands down which they flow.* If the land project a considerable way into the great ice-lake, then the glacier is a long one; if the contrary be the case, then it is hardly distinguishable from the great interior ice-field, and, as in the case of the glacier of Humboldt in Smith's Sound, the interior ice may be said to discharge itself almost without a glacier. The face of Humboldt's glacier is in breadth about sixty miles. This, therefore, I take to be the interspace between the nearest elevated skirting land on either side. It thus appears that, between the inland ice and the glacier, the difference is one solely of degree, not of kind, though, for the sake of clearness of description, a nominal distinction has been drawn.

* Properly speaking, according to the ordinary nomenclature, the whole of the ice, from the *névé* downwards, should be called *glacier*; but as we have not yet penetrated sufficiently far into the interior to observe where the *névé* ends and the *glacier* begins, I have, for the sake of distinctness, adopted the above arbitrary nomenclature.

VIEW OF FRANZ-JOSEPH FJORD AND OF PETERMANN'S PEAK, EAST GREENLAND.

The glacier, as I have said, will usually flow to the lowest elevation. Accordingly it may take a valley, and gradually advance until it reaches the sea. In the course of ages this valley will be grooved down until it deepens to the sea-level. The sea will then enter it, and the glacier-bed of former times will become one of those fjords which indent the coast of Greenland and other northern countries, often for many miles; or these may be much more speedily produced by depression of the land, such as I shall show is at present going on. By force of the sea the glacier proper will then be limited to the land, and its old bed become a deep inlet of the sea, hollowed out and grooved by the icebergs which pass outwards, until, in the course of time, by the action of a force which I shall presently describe, the fjords get filled up and choked again with icebergs, in all probability again to become the bed of some future glacier stream. In alpine regions, far away from the coast, the glacier, as it pushes its way down into warmer regions, either advances or retreats, according to the heat of the summer; but in either case it gives off no great masses of ice from its inferior extremity. The same is true of the Arctic glacier when it protrudes into some mossy valley without reaching the sea; but when it reaches the sea another force comes into operation. We have seen (1) the inland ice-field emptied by (2) the glacier; we now see the glacier relieving itself by means of (3) the iceberg, or "ice mountain," as the word means.

When the glacier reaches the sea it grooves its way along the bottom under the water for a considerable distance; indeed, it might do so for a long way did not the buoyant action of the sea stop it. For instance, in one locality in South Greenland, in about $62^{\circ} 32'$ N. lat., between Fredrikshaab and Fiskernæs, or a little north of the Eskimo fishing station of Avigait, and south of another village called Tekkisok, is a remarkable instance of this. Here the inland ice is separated from the open sea only by what is virtually a strip of low alluvial land intersected by water-courses issuing from the glacier. The front of the ice is the so-called "ice-blink," a term which English seamen use to designate the "loom" of ice at a distance, but which is here applied to a sandy beach stretching before it, and over which it may in time slowly crawl, and present a transverse barrier to the currents. It was long supposed that the iceberg broke off from the glacier by the mere force of gravity: this is not so. It is forced off from the parent glacier by the buoyant action of the sea from beneath. The ice groans and creaks; then there is a crashing, then a roar like the discharge of a park of artillery, and with a monstrous regurgitation of waves, felt far from the scene of disturbance, the iceberg is launched into life. The breeze which blows out from the land, generally for several hours every day, seems, according to my observation, to have the effect of blowing the bergs out to sea; and then they may be seen sailing majestically along in long lines out of the ice-fjords. Often, however, isolated bergs, or groups of bergs, will float away south or north. Occasionally a vessel will be driven on to a grounded berg. Such an accident happened to the steam-tender *Intrepid*, one of Sir H. Austin's squadron, in the Franklin Search Expedition of 1850-1. She, however, escaped uninjured, though enlaced in a cradle on the side of a berg formed by the broken floe, &c., as shown in the sketch made at the time by Commander May, R.N. (See Plate I.)

Bergs from the ice-streams of Baffin's Bay will be found in the southern reaches of Davis' Strait; while others, bearing *débris* which could only have been accumulated in South Greenland, will be found frozen in the floes of Melville Bay or Lancaster Sound. It is a

common mistake, but one which a moment's reflection would surely dissipate, that bergs found in the south must all have come from the north, and that those farther north must have come from the regions still farther northward. The winds and the currents waft them hither and thither, until, by the force of the waves, they break into fragments and become undistinguishable from the oozy fragments of floes around them. Often, however, they will ground either in the fjord or outside of it, and in this position remain for months, and even years, only to be removed by pieces calving or breaking off from them, and thus lightening them, or forced off the bank where they have touched the bottom by the force of the displaced wave caused by the breaking off of a fresh berg. Ice much exposed to the sea breaks off in small ice-calves, but not in bergs. This calving will sometimes set the sea in motion as much as sixteen miles off. The colour of the berg is, of course, that of the glacier; but by the continuous beating of the waves on it the surface gets glistening. The colour of the mass is a dead white, like hard-pressed snow, which in reality it is, while scattered through it are lines of blue. These lines are also seen in the glacier on looking down into the crevasses, or at the glacier-face, and are, in all probability, caused by the annual melting and freezing of the surface-water of the glacier. Then another fall of snow comes in the winter; then the suns of summer melt the surface to some slight extent; this freezes, forming an ice different in colour from the compressed snow-ice of the glacier, and so on. I am aware, however, that this is a subject of controversy; and this view of mine is only brought forward as a probable explanation, suggested to me as far back as 1861, when I first saw glaciers in the upper reaches of Baffin's Bay and on the western shores of Davis' Strait, and long before I was aware that this streaked or veined character of glacier-ice had been a subject of dispute.*

Tyndall considers that the veined or ribboned structure of alpine glacier is owing to the presence of spaces from which the air-bubbles in the ice have been wholly expelled, translucency being thus converted into transparency. These blue veins are apparently caused by pressure. The pressure is exerted in three directions, producing veins which are complementary to the three kinds of crevasse—transverse, longitudinal, and marginal.

The greater portion of the bergs form long streams opposite their "ice-fjords," these streams being constantly reinforced by fresh additions poured out from the fjord. Hence certain localities in Greenland are distinguished by their "ice-streams;" these localities being invariably opposite the mouths of ice-fjords, or fjords with great glaciers at their landward end pouring out icebergs. . . . Wherever these glaciers terminate the glacier stream will be found.

What is under the ice no man can say. No doubt the country is undulating, but it must now be well worn down by the immense mass of ice which has been for ages moving over it. The amount of mud pouring out into the fjords is very great. In some cases it is shoaling up the fjords, and in a few cases has effectually blocked them. The mud is fine, and soon gets laminated. . . . The Arctic shellfish burrow into it, and when the

* These blue stripes are several feet in dimension, and in them are generally found the "dirt-bands" of foreign matter (stones, gravel, clay, &c.), the remains of the moraine. Dr. Rink thinks that the blue stripes are formed by a filling up of the fissures in the inland ice with water—"perhaps mixed with snow, gravel, and stones; and such a refrigeration of the water in the fissures may be supposed to be an important agency in setting in motion these great mountains of ice."

petty tiles of the far North are at ebb, they are exposed in long dreary flats, over which the icy winds from the interior blow with bitter force. When the glacier reaches the sea, the stream flows out under the water, and, owing to the smaller specific gravity of the fresh water, rises to the surface, as Dr. Rink describes, "like springs"—though he does not consider (as some have supposed him to do) that that water was in reality spring-water, or of the nature of springs. Here are generally swarms of Entomostraca

ARCTIC LAKE IN THE HEIGHT OF SUMMER.

(or water-fleas) and other marine animals. These attract flights of gulls, which are ever noisily fighting for their food in the vicinity of such places.

We lived for the greater portion of a whole summer at Jakobshavn, a little Danish post, in latitude $69^{\circ} 13' N.$, close to which is the great Jakobshavn ice-fjord, which annually pours an immense quantity of icebergs into Disco Bay. In early times this inlet was quite open for boats; and Nunatak (a word meaning a "land surrounded by ice") was once an Eskimo settlement. There was in 1867 an old man (Manjus) living at Jakobshavn whose grandfather was born there. The Tassiusak, an inlet of Jakobshavn ice-fjord, could at that time be entered by boats. Now-a-days, Jakobshavn ice-fjord is so choked up by bergs that it is impossible to go up in boats, and such a mode of entering it is never thought of. The Tassiusak must be reached by a laborious journey over land; and Nunatak is now only a distant island surrounded by the inland ice—a place where no man lives, or

POLAR BEAR ATTACKED BY ESKIMO DOGS.
(From an Original Sketch.)

has, in the memory of any one now living, reached.* Both along its shore and that of the main fjord are numerous remains of dwellings long uninhabitable, owing to it being impossible to gain access to them by sea. The inland ice is now encroaching on the land, though at one time it appears to have covered many portions of the country at present bare. This advance and retreat of the inland ice may be due to change of climate, to the rapid advance† of the ice from the interior, or to the rise and fall of the land (p. 67).

There are traditions that a great inlet once stretched across Greenland not far

VIEW OF JAKOBSHAVN, NORTH GREENLAND. (From an Original Sketch.)

from this place, as represented on some of the old maps, but that it has also now got choked up with consolidated bergs. In former times the natives used to speak of pieces of timber drifting out of this inlet, and even tell of people coming across; and stories yet linger among them of the former occurrence of such proofs of the openness of the inlet. All that we know is, that such a trans-continental passage, if ever it did exist, is now shut up. The glacier and the ice-stream have not changed their course, though, if

* All rocks or islets surrounded by the "inland ice" are called "Nunataks" by the Greenlanders.

† From observations made in the summer of 1875, at Jakobshavn Fjord, Helland, a Norwegian geologist, estimated this at 47 feet *per diem* in summer. Unless there is some great error in these observations, this extraordinary rate of motion is from twenty to thirty times greater than glaciers have been observed to move in temperate zones.

the shoaling of the inlet goes on (and should the glacier continue at its head, nothing is more certain), then it is just possible that the friction of the bottom of the inlet may overcome the force of the glacier, and that the ice may seek another course. As the neighbourhood is high and rocky, this is hardly possible with the present contour of the land. At the present day, the whole neighbourhood of the mouth of the glacier is full of bergs; and often we should be astonished on some quiet sunshiny day, without a breath of wind in the bay, to see the "ice shooting out" (as the local phrase is) from the ice-fjord, and the little bay in front of our door in Jakobshavn Kirke covered with huge icebergs, so that we should find it necessary to put off our excursion to the other side of the inlet; and the natives would stand hungry on the shore, as nobody would dare put off in his *kayak* to kill seals, being afraid of the falling of the bergs. In a few hours the bay would be clear, until another crop sprang out from the fjord. At any time to venture near these bergs would be attended with great danger; and the poor Greenlanders often lose their life in the attempt, as the bergs, even when aground, have always a slight motion, which has the effect of stirring up the food on which the seals subsist.

Accordingly, the neighbourhood of these bergs is favourable for seals, in the attempt to capture which the hapless "kayaker" not unfrequently loses his life by falling ice. When we would row between two to avoid a few hundred yards' eirenit, the rower would pull with muffled oars and bated breath. Orders would be given in whispers; and even were Sabine's gull or the great auk to swim past, I scarcely think that even the chance of gaining such a prize would tempt us to run the risk of firing, and thereby endangering our lives by the reverberations bringing down pieces of crumbling ice hanging overhead. A few strokes, and we are out of danger; and then the pent-up feelings of our stolid fur-clad oarsmen find vent in lusty huzzahs! Yet, when viewed out of danger, this noble assemblage of ice palaces—hundreds in number being seen at such times from the end of Jakobshavn Kirke—was a magnificent sight; and the voyager might well indulge in some poetic frenzy at the view. The noonday heat had melted their sides; and the rays of the red evening sun glancing askance among them would conjure up fairy visions of castles of silver and cathedrals of gold floating in a sea of summer sunlight. Here was the Walhalla of the sturdy Vikings; here the city of the sun-god Freyr; Alfheim, with its elfin caves; and Glitner, with its walls of gold and roofs of silver; Gimle, more brilliant than the sun; Gladsheim, the home of the happy; and there, piercing the clouds, was Himmelberg, the celestial mount, where the bridge of the gods touches heaven.* Suddenly there is a swaying, a moving of the water, and our fairy palace falls in pieces; or, with an echo like a prolonged thunder-peal, it capsizes, sending the waves in breakers up to our very feet. The whole scene was worthy of Coleridge's graphic, though now hackneyed, lines in "The Ancient Mariner," in which he says:—

"And ice, mast-high, came floating by,
As green as emerald."

Some of these icebergs are of enormous size. Hayes calculated that one stranded in Baffin's Bay, in water nearly half a mile in depth, contained about 27,000,000,000 cubic

* Hayes' "Open Polar Sea," p. 29.

WAVE-WORN ICEBERGS.

during my visits to Greenland and other portions of the Arctic regions. "Raised beaches" are found all around the Greenland coasts, in which shells, &c., of the same species as those now to be seen in the neighbouring seas, are found, and on the surrounding ice-shaven hills are found angular "perched blocks" of rock, which could only have been dropped there by icebergs which had floated over the submerged country. These raised beaches the various explorers of Smith's Sound found also there, and deduced the conclusion that the whole coast north of the Danish possessions was rising, because within the Danish possessions facts had been observed

LOWER END OF THE GLACIERS IN FRANZ-JOSEF FJORD.

showing that there it was falling. In reality, though I am not prepared to say that the coast is not rising in Smith's Sound as in many other parts of the circumpolar regions, yet as the same raised beaches or terraces are also found in South Greenland, the probabilities are that Smith's Sound does not differ from the rest of Greenland. In other words, the coast *has* risen, it is now again falling. On the coast of South Greenland houses are not only seen beneath the water, showing that it had fallen, but also further above the sea-level, where no Greenlander would now build them. The facts, proving that the coast has been long sinking, are well known to geographers. Between 1770 and 1779 Aretander noticed that, in Igalliko Fjord, a small rocky island, "about a gunshot from the shore," was entirely submerged at spring-tides; yet on it were the walls of a house (dating from the period of the old Icelandic colonists) fifty-two feet in length, thirty in breadth, five in thickness, and six in height. Fifty years later the whole of it was so submerged that only the ruins rose above the water.

WAVE-WORN ICEBERG.

The settlement of Julianshaab was founded in 1776 in the same fjord; but the foundations of the old store-house, built on an island called "The Castle," are now dry only at very low water. Again, the remains of native houses are seen under water near the colony of Frederikshaab. Near the great glacier which projects into the sea between Frederikshaab and Fiskernæs, there is a group of islands called Fulmarlalik, on the shores of which are the ruins of dwellings over which the tide now flows. In 1758, the Moravian *Unitas Fratrum* founded the mission establishment of Lichtenfels, about two miles from Fiskernæs, but in thirty or forty years they were obliged once, "perhaps twice," to remove the frames or posts on which they rested their large *umiaks*, or "women's" (sealskin) "boats." The posts may yet be seen beneath the water.

To the north-east of Godthaab, on a point called Vildmandsnæs (Savage Point) by Hans Egede, several Greenland families lived in 1721-36. These dwellings are now desolate, being covered with water at high tide. At Nappersoak, forty-five miles north of Sukkertoppen, the ruins of old Greenland houses are also to be seen at low water.

In Disco Bay I had another curious instance brought under my notice. The blubber-boiling house of that post was originally built on a little rocky islet, about one-eighth of a mile from the shore, called by the Danes "Spek-Huse-Oe," and by the Eskimo "Krowelenwak," which means just the same thing—viz., "Blubber-house Island." For many years the island has been slowly sinking, until in 1867, the year of our visit, the superintendent of the settlement had been under the necessity of removing the house from it, as the island had been gradually subsiding until the floor of the dwelling was flooded at high tide, though, it is needless to say, it was sufficiently far above high-water mark when originally built. On another island in its vicinity the whole of the Claushavn natives used to encamp in the summer, for the treble purpose of drying seals' flesh for winter use, of being free from disturbance by the dogs, and of getting somewhat relieved from the plague of mosquitoes; but now the island is so circumscribed that the natives do not encamp there, the space above water not allowing of room for more than three or four skin tents. Exactly similar facts have been observed at Frederikshaab and other localities in South Greenland.

I have made an attempt to estimate the rate of fall; and though we have no certain data, I believe that it does not exceed five feet in a century, if so much; so that none of us will live to see Greenland overspread by the sea. Such at least are the views I have arrived at from a careful study of this question, and little doubt remains in my mind as to their general correctness. The only serious reason for hesitating to ask the reader to accept this elucidation of the subject is, that it would appear that for some indefinite period there has been a gradual elevation of most of the circumpolar region going on. The facts in regard to this have been carefully collated by Mr. H. Howorth, though it must be acknowledged with apparently a foregone conclusion, or at least a strong bias to the doctrine he has espoused. One fact I may here mention, as it has not been noticed by Mr. Howorth. A few years ago the Norwegian walrus hunters discovered a group of small islets north of Novaia Zemlia. They were merely sandy patches scattered with boulders dropped from icebergs which had at one time floated over them, and raised but a few feet above the sea—

"—— islands salt and bare,
The haunt of seals and ores and sea-mews' clang."

On some of the islets—notably on Hellwald's and Brown's—were found West Indian fruits washed up by the Gulf Stream: hence they were named "The Gulf Stream Islands." Yet only about two centuries ago the Dutch took soundings on the very spot where these islands have since been gradually raised above the sea. It is also said that the whale (*Balena mysticetus*) has left the Spitzbergen Sea, owing to the waters having got too shallow for it, on account of the gradual rise of the bottom. Mr. Lamont found bones in hollows in Spitzbergen, which he was inclined to believe were the remains of whales killed by man, that had been towed into these localities when they were shallow bays, though now dry land, in order to be "fensed." On Franz-Josef Land there are also raised benches.

The "fjords," or inlets which are found in the northern and southern hemispheres, have in all likelihood been the beds of ancient glaciers when the coast was higher than now; and the "lochs" of the West of Scotland are of the same nature. While speaking on this subject, it may be mentioned in passing, that geologists are now almost at one in believing that Scotland and a great portion of the north of Europe, America, and probably also Asia, were, during what is called the "Glacial Period," swathed in ice much the same as Greenland now is. In every quiet Scottish glen we find traces that at one time these were the beds of ancient glaciers. There are the rounded boulders which the peasant will tell us were brought hither by witches, though in reality a more wonderful agent than any "wise woman" was the carrier that conveyed them, the scratched rocks, the *roches moutonnées*, and the rough "boulder clay," such as most likely underlies modern glaciers, and the finely laminated clay, such as is now washed out from under the glaciers, and deposited in the Greenland fjords. To enter, however, upon these facts would take up too much space, besides being rather beside our subject. They are found recorded, with more or less accuracy, in various works, the authors of which, no matter how widely they may differ, agree in the main facts upon which we have touched.

CHAPTER IV.

LIFE IN POLAR LANDS.

MORE than two hundred years ago Edward Pellham, first of English mariners who had the courage to winter in Spitzbergen—or Greenland, as he called it—and the good fortune to come back and tell the tale, wrote these words:—"Greenland is a country very furre northward . . . the land wonderfull mountainous, the mountaines all the year long full of yce and snow, the plaines in part bare in summer time . . . where growes neither tree nor hearbe . . . execept scurvygrass and sorrell . . . the sea . . . as barren as the land, affording no fish but whales, sea-horses, seals, and another small fish . . . and hither is a yearely fleet of English sent." The devout old seaman's dictum was, no doubt, a fair *résumé* of the popular knowledge of his period, and is at the present day not an inapt reflection of the common ideas regarding the barrenness of life in the Arctic regions.

In reality, the Polar lands are not devoid of life, except in the extreme north. The species of plants and animals may not be many, but the individuals of those which live in these extremities of the earth are far from few. (See also pp. 19, 23,-27, 32, &c.)

PLANTS, ETC.

Flowering plants, in all likelihood, extend to the Pole itself. In Franz-Josef Land—discovered in 1873 by the Austrians, and wintered on in 1881-2 by Mr. Leigh Smith's

THE QUAN. (*Archangelica officinalis*.)

party—Arctic barrenness seems to have reached its acme. It equals Spitzbergen in extent, and consists of several large masses of land—Wilezek Land in the east, Zichy Land in the west—which are intersected by numerous fjords, and skirted by a large number of islands. A wide sound (Austria Sound) separates these masses of land. It extends north from Cape Hansa to about latitude 82° north, where Rawlinson Sound forks off to the north-east. Trap, or whinstone, of the variety called dolerite, is the prevailing kind of rock, and small beds of brown coal were discovered. The mountains reach a height of from 2,000 to 3,000 feet, and on the south-west attain, in Richthofen Peak, an altitude of even 5,000 feet. There are also gigantic glaciers, and the *névé* is much more elevated above the sea than in Greenland or Spitzbergen. All the low islands in Austria Sound are covered with an ice-cap. The vegetation is, however, far poorer than that of Greenland, Spitzbergen, or Novaia Zemlia ;

and, excepting in the Antarctic regions, we have the assurance of Lieut. Payer that no country exists on the face of the earth which is poorer in that respect. The general physiognomy of the flora, but not the species, resembles that met with in the Alps at an elevation of 9,000 to 10,000 feet. The season during which the discoverers of the country visited it was certainly that in which vegetable life first puts forth its appearance, and most of the slopes were still

GROUP OF ESKIMO.

covered with snow; but even the most favoured spots near the sea-level, which were no longer covered with snow, were unable to induce them to arrive at a different conclusion. "On level spots we scarcely met with anything but poor and solitary bunches of grass, a few species of saxifrage and *Silene acaulis*. Dense carpets of mosses and lichens were more abundant, but most plenteous of all was a lichen—the wintry *Umbilicaria arctica*. Driftwood, mostly of an old date, was met with on many occasions, but only in small quantities. We once saw lying, only a trifle higher than the water-line, the trunk of a larch, above a foot thick, and some feet in length. The driftwood, like our vessel, had probably been drifted to these latitudes by the winds—in all likelihood from Siberia—and not by currents. The country, as might have been supposed,

has no human inhabitants; and in its southern portions scarcely any animals, except bears, are met with. Many portions of this newly-discovered country are exceedingly beautiful, though it bears throughout the impress of Arctic rigidity."*

It may be added that the bears in Franz-Josef Land were much less fierce than in East Greenland, where they not only sometimes attacked the German explorers in the vicinity of Franz-Josef Fjord (p. 61), but even carried off one of the crew out of the ship. Bears were frequently met during the winter, but always males, so that this almost settles the disputed question of the hibernation of the females. On Rudolph Land an increase of temperature was noticed. The explorers had previously noticed the flight of birds from the north; here they found the rocks covered with thousands of auks and divers. They rose up in immense swarms, and filled the air with the noise of their vehement whirring, for breeding-time had arrived. Traces of bears, hares, and foxes were met with everywhere, and seals crept sluggishly upon the ice. When Auk Cape was rounded it resembled a gigantic aviary. Walrus were seen only twice. In Spitzbergen there is, probably, a richer flora than in Novaia Zemlia, though this latter island contains the lemming and the ermine among its mammals, which are not found in the former. Spitzbergen possesses over 110 species of flowering plants, but among its insects beetles are not numbered, though above twenty species have been found in West Greenland; yet Spitzbergen has thirteen of the bee order (*Hymenoptera*), while only three have been noticed in West Greenland. In Greenland, again, butterflies and moths are common—twenty-six different kinds have been captured; but as yet only one specimen has been noticed in Spitzbergen. Two-winged insects are almost twice as plentiful in Spitzbergen as in Greenland (forty-nine to twenty-six). The vegetation of East Greenland, as explored by the Germans, agrees in all important points with that of West Greenland, though the species are fewer. Seven species of plants have, however, been found in East Greenland which are unknown in the West. The general character of the flora of West Greenland I have already noted. It comprises over 370 species of flowering plants and ferns, while but 204 species have yet been recorded from East Greenland. Plants have been found as far north as man has yet gone in Smith's Sound. In this region life teems. The sea abounds in walrus, seal, narwhal, and white whale; the land in foxes, reindeer, eider-ducks, wild geese, snipe, and various gulls and other sea-birds. Whales, seals, walrus, and bears find their principal haunts in the sea. In Thank-God Bay, Hall's party found the plain free from snow, a creeping herbage covering the ground, on which many musk-oxen were pasturing, while hares and lemmings abounded. The wild flowers were bright in colour, and flocks of birds of passage came north; indeed, so abundant is life nearly everywhere within the Arctic Circle, that there are few localities where well-arranged parties of skilful hunters could not live by the produce of their guns or traps. At Cape Columbia, in latitude $83^{\circ} 7' N.$, the larger animals cease to be found (Nares). The Eskimo is not a vegetable feeder, for the simple reason that he has no vegetables to feed on; yet when he can he uses a few food-plants. In Kamshatka the natives are only to a very limited extent vegetable feeders, but even the wildest denizens of the far North try and obtain some plants to vary their flesh diet.

Among the scanty vegetable products which the Arctic regions yield must be classed

* Payer: "Proc. Roy. Geog. Soc.," Vol. XIX., pp. 17, &c.

the various edible berries. The cranberry, the whortleberry, the cowberry, and the crowberry are the chief. The crowberry (*Empetrum nigrum*) and the whortleberry are the only ones which the Greenlanders use, and even now they use them much less than they did formerly. At one time enormous quantities were gathered, and, after being mixed with train oil, were eagerly devoured as a prime Eskimo luxury. In some places the plants bear so plentifully that they look like bunches of grapes, and almost blacken the turf composed of the dwarf birch, and the gay alpine rose (*Rhododendron lapponicum*). The *Archangelica officinalis*, or "quan" (p. 72), is another of the favourite Greenland edible herbs. It has been long used in Norway (the reader may remember that King Olaff, in the Saga of Heimskringla, gave angelica-stalks as a present to the haughty Queen Thyra), and it is probable that the Greenlanders first ate it in imitation of the Scandinavians. It is only to be seen on the island of Disco, and in one spot, up a fjord, in 64° north latitude. Hence the Greenlanders say that Disco was towed from the latter locality to its present position, in 70° north latitude. A species of houseleek (*Sedum rhodiola*), *Pedicularis hirsuta*, *Epilobium latifolium*, two varieties of sorrel, and the scurvygrass (*Cochlearia*) may be also mentioned among the other edible plants of the Arctic regions. Seaweeds are also eaten, and, indeed, have on many occasions in times of scarcity saved people from starvation. In Greenland attempts have been made to raise some of the common plants of European gardens. At the Danish station of Godthaab (latitude 64°), close to the open sea, turnips, radishes, lettuces, and parsley are almost the only plants that can be cultivated with any success. The turnip, indeed, requires a favourable summer to produce anything like tolerable specimens. The cabbages are scarcely worthy of the name; but at two inland stations up the fjord, about thirty miles north of Godthaab, the climate is strikingly different. Here, Dr. Rink informs us, turnips always come to perfection; carrots prosper well, and attain a fair size; and cabbages, though unable to develop thick stalks, yet produce tolerably large leaves, which the provident Danes stow away for winter use. Attempts have been made to cultivate potatoes, but the tubers never attain a size larger than marbles, and are only grown and eaten as curiosities. Under the most favourable circumstances, green peas only produce shells, in which the peas are barely recognisable. This is within the Arctic Circle, or at least on its immediate borders. In South Greenland—the site of the old Norsemen's settlements—horticulture is practised under more favourable circumstances. At some of the posts, in about the same latitude as Christiania, good carrots have been produced, and in a forcing-frame strawberries have grown well, and yielded fruit for several years, but they afterwards died, owing probably to the severity of the climate. At Julianshaab turnips often attain a weight of more than half a pound, and are fit for table in the middle of July. Radishes are fit to be eaten in the middle of June. Rhubarb grows pretty vigorously, and can be raised from seeds. Green cabbage attains a good size, but never the normal taste and pungency of the vegetable. At Jakobshavn, in 69° 13', our good friend Dr. Pfaff used to raise a few radishes, and the locality being sheltered, the tiny patch of earth on the rocks, which in that remote place passed for a garden, produced "crops" almost as luxuriant as Godthaab in the south. While out-door cultivation is next to a forlorn hope in horticulture, Greenland is exceedingly well adapted—probably owing to the continual summer daylight—for the in-door cultivation of European plants. Geraniums, fuchsias, and

other of our common flowers flourish abundantly in the house of every tasteful Greenland "Colonibestyrrer," or superintendent of a settlement, and wherever the Danish ladies go, they carry with them the well-beloved flowers of their native land, as mementoes of home, to console them in their voluntary exile.

Sir J. Hooker has so thoroughly investigated the nature of the Arctic flora and its distribution, that it would be a waste of space to attempt to give a popular recapitulation of his views within the limits we have assigned to this portion of the subject. His memoir is accessible to those interested in this rather technical question.* It is enough for us to say that he divides it into the plants of Arctic Europe, Arctic Asia, Arctic West America, Arctic East America, and Greenland. The flora of Greenland is peculiar in this respect,

SADDLEBACKS (*Phoca groenlandica*) ON THE ICE.

that though Greenland is close to America, and far distant from Europe, the plants are essentially those of Norway, and not of the nearer American shore. The cause of this is not difficult to seek. It points to the probability of Baffin's Bay and Davis Strait having been long gulfs intervening between Greenland and the opposite mainland of America, preventing the two floras intermixing. On the other hand, the similarity—we might say identity—of the Northern European and Greenland floras renders it highly probable that at one time Europe and Greenland were united; indeed, both the flora and fauna—plants and animals—of East Greenland and Scandinavia are more alike than those of West Greenland. In the not very remote past, either a continuous continent—such as geologists believe to have at one time joined Europe and America—or a chain of islands covered over what is now a sea. Iceland, even Spitzbergen, Jan Mayen, and possibly the Faroe Islands, Shetland, and Orkney, are only the remnants of this land over which the European

* "Transactions of the Linnean Society," Vol. XXIII. (1861), pp. 251—348; and the Admiralty's "Manual of the Natural History of Greenland" (p. 19), which is also an encyclopædia of all other branches of Arctic Natural History.

plants travelled to Greenland. Birds of passage from Europe may convey seeds on their feathers, &c., but these must be very few; and, moreover, there are birds of passage also arriving every summer in Greenland from America; so that this favourite method of accounting for the transport of plants operates both ways.

ANIMALS.

The Arctic seas swarm with life. The dredge brings up hosts of shell-fish, crustacea (the crab and shrimp order), sea-urchins, and starfishes; and often the calm surface of the

ESKIMO WATCHING FOR A SEAL.

ocean is swarming with the varied forms of jelly-fishes—some great, others sufficiently large to aid in giving that splendid phosphorescent appearance to the Arctic Ocean which is so marked, especially during the dark autumn nights which succeed the long summer day. Sponges, and even corals of a tiny description, are found in some portions of the Arctic Ocean, while the minute, almost microscopic, *foraminifera* are numerous.

The land fauna is neither so varied nor so exuberant. It is the sea animals which pre-eminently supply the chief attractions for man—savage and civilised—in these far northern regions; and among all these the seals and whales are the principal animals hunted.

Seal-hunting is one of the great arts of the Arctic region—I might almost say the greatest of all the occupations which attract Europeans to those inhospitable zones—and the most important occupation of the natives themselves. It is pursued in two ways: first, on a large scale, during a few weeks in the year, by the European ships which leave Scotland and the northern ports of the Continent for that purpose; and throughout the year

by the natives themselves. The Greenlander may be taken as the type of the Arctic seal-hunter. To him the seal is all in all. It affords him food, light, and clothing, and even its bones and intestines supply material for hunting implements and articles of domestic economy. There are, exclusive of the walrus, five species of seals on the Greenland coast. None of these are stationary all the year round, but some of each kind are always to be found in greater or less abundance. A Greenlander is trained from early youth in all the art and mystery of paddling a kayak, or skin canoe, and of hunting the different species of seals. Without having learnt, and being thoroughly acquainted with this art, he could not live in the frozen North. The general principle adopted is that employed by the Europeans in killing whales, viz., striking the seal with the harpoon, the line of which is attached to the inflated "drogue," or bladder, and then, after it has tired itself out diving and rising to the surface to breathe, to kill it with the lance. When the seal is only a small one the bladder-arrow is used. This so-called bladder-arrow is a small harpoon without a line, and with only a small bladder to buoy up the weapon should it miss its mark. This weapon is also employed in the "halloo hunt," which consists in a number of Greenlanders driving a flock of seals into a narrow inlet or bay, and slaughtering them in this confined place. Firearms have been introduced by Europeans, and have now, to a great extent, replaced the native weapons. In seal-hunting, however, the rifle can, owing to the seal sinking so rapidly, be only used when the hunter is stalking the sleeping seal on the ice-fields during the winter and early spring. Sometimes a dog is employed to point the seals, being covered over with snow, and only to be detected in daylight by the steam which rises into the frosty air. The wild Eskimo of the western side of Davis Strait use this method of hunting much during the winter season. When the seal is found the hunter plants his spear in its body, and holds on by the line until it rises again, if he does not succeed in killing it immediately (p. 77). A little white screen raised on a tiny sled is also employed to stalk the sleeping seal. The barrel of the musket is rested on the cross-bars between the supports of the screen, the barrel merely protruding through a hole in it. This the hunter pushes gently before him. To the quick-eared seal it looks simply like a piece of ice, and is disregarded after the first alarm. The stalker approaches until he is within shot, and may think himself fortunate if the seal, in the first agonies of the wound, do not roll over, and disappear down the breathing-hole in the ice, near which it always lies ready to disappear at the first sign of danger. I have seen the wild Eskimo of the western shores of Davis Strait adopt much the same method of stalking the seal, only in this case they dispensed with the screen, and depended on getting within shooting distance by rolling over and over, tossing a little snow in the air, and frisking, after the manner of their prey, which their dress of sealskin gave them every advantage in doing. To protect their arms and hands from abrasion by the ice they used to wear gauntlets of bear-skin, a pair of which the writer still possesses. A white shirt was also eagerly coveted by them, in order that, by putting this over their ordinary dress, they might be better enabled to simulate the colour of the ice and snow among which they were sliding along. Seals are also captured with nets, either singly or in droves; indeed, the different methods of capturing seals by the Eskimo form one of the most interesting of the chapters which Dr. Rink, the quondam Governor of Greenland, has written

upon the northern land which he so long ruled. The inhabitants of the Arctic regions also kill the different species of whale, though their *modus operandi* does not greatly differ, in its general principles, from that adopted by the Europeans, to be presently described.

In all there are five seals within the Arctic regions: the saddle-back, or harp seal, so called from the shape of the dark mark on the back of the male (*Phoca groenlandica*, p. 76); the fleo-rat (*Phoca felida*); the bladder-nose—deriving its name from the inflated hood, or “caul,” as the old navigators call it, on its forehead (*Cystophora cristata*); the fresh-water seal (*Phoca vitulina*), which, though the most common seal on our shores, is the rarest in Polar lands, and the ground or grown seal (*Phoca barbata*). The first two, with a few of the ground seals, are those chiefly killed by the European sealers. All of them are “hair” seals, their hides being only used for leather, or by the Eskimo for clothing and the other varied uses to which they put every part of this animal.* The different species of fur seal are confined to the North and South Pacific, and in the former locality penetrate within the Arctic Circle; but the “fishery” of the fur seal can be best described when we are engaged, farther on, in considering the fur countries proper, their products and their industries. Though the Greenlanders and other Eskimo tribes kill many thousands every year, yet the vast majority of the seals brought to this country, to the Continent, and to America, are obtained by the slaughter of the flocks of them which congregate in the spring on the fleo-ice off the coast of Newfoundland, Labrador, and in the vicinity of the island of Jan Mayen, between Iceland and Spitzbergen.

The ships engaged in the Newfoundland and Labrador sealing are very often “country vessels”—i.e., belonging to the port of St. John’s; but those which frequent the Jan Mayen, or “Greenland sealing,” as it is erroneously called, are chiefly from Scotland, Holland, Germany, and Norway, and generally those which afterwards go to the whaling (Chapter V.). They leave home about the last days of February or the 1st of March, and after calling in at Lerwick, in Shetland, for “extra hands,” arrive at the edge of the Arctic ice in ten days or a fortnight at the outside after leaving *Ultima Thule*. They coast along its “bight,” or edge, looking for the flocks of young seals, or penetrate the leads or openings in the ice-field (p. 52) in search of their prey. The old seals are not so easily killed as the young ones; accordingly, the sealers wait until the seals whelp, or “pup,” in order that they may slaughter the white-coated young. From fourteen to twenty days lapse ere the pups can take to the water; accordingly, during that time they fall an easy prey to the sealers, who land in groups, armed with spiked clubs, and provided with “rueruddies,” or ropes attached by broad belts over their shoulders. A blow over the nose by the club or heavy boot is generally sufficient to kill, or at least to stun, the young seals. As these flocks will sometimes number many thousands, stretching far and near, the slaughter is immense. No sooner are they killed than another man whips out his knife and; by a few adroit cuts, turns the carcase out of the jacket—i.e., the hide and blubber combined. The hides are then collected in piles, and dragged by the “rueruddies” to a convenient place for being taken off by the boats, which are continually plying between the ship and the ice; or, if the ship be frozen in, they are dragged to its side; then

* For which I may be allowed to refer the reader to my notes on the Seals of Spitzbergen and Greenland in “Proceedings of the Zoological Society” (1868); or the Admiralty’s “Manual of the Natural History of Greenland,” &c. (1875); Rink’s “Danish Greenland” (1877); and Allen’s “N. A. Pinnipeds” (1880).

they are dropped into the hold, and after, at a "slack time," are taken up again, the blubber sliced off, and the skins salted, for better preservation, until the vessel arrives home. The number killed is sometimes enormous: vessels have arrived in Dundee with as many as 22,000 seals, the product of only a few weeks' slaughter. Of late years an attempt has been made to get the different European governments engaged in the business to agree to a "close time." This proposal has been successful, though it was somewhat doubtful, looking at the question purely from a commercial view, whether this would be possible. The greater number of the seals killed are young ones, and the immense slaughter solely depends on the fact that the pups, or "white-coats," are unable to take to the water, and so fall an easy prey to their murderers. The old ones will remain as long as possible guarding their young, and even after they have left the ice will sometimes raise themselves up and severely bite the unwary "hunter." However, the 3rd of April is the date now fixed for beginning the Jan Mayeu sealing.

Sometimes the sealers penetrate as far north as between 70° and 73° N. latitude, and there continue sailing about until they find the seals, which they generally do about the first week in April. If they do not get access to them, they remain until early in May, when, if they intend pursuing the whaling in the Spitzbergen sea that summer, they go north to about 74° N. latitude, to the "old sealing," or further still—even to 81° N.—to the whaling. Most of them, however, if not successful by the middle or third week of April, leave for home, to complete their supplies, in order to be off by the 1st of May to the Davis Strait whale fishery. During the month of March and the early part of April the sealers are subject to all vicissitudes of weather, calm and storm suddenly alternating, while the thermometer will stand for weeks at zero, or even many degrees below it. Many risks are run by men being turned adrift on pieces of ice, owing to storms arising, and accidents from this and other causes are frequent.

In Newfoundland the seal-fishery is an important element in the prosperity of that ancient, if frigid, colony. It is carried on by sailing vessels and steamers, the crews of which number from 20 to 250 men. The sailing vessels begin work not earlier than the 5th of March, and the latter not earlier than the 10th of the same month, a "close time" to this extent having been enforced by the colonial Legislature. The "take" of the Labrador sealers is even more enormous than that of the Greenland ones. For instance, in the spring of 1872 the steamer *Commodore* brought into port 31,314 seals, weighing 655 tons, and valued at £23,731 16s. 9d. Yet this vessel was only 290 tons, and as she sailed into the port was so deep that one side of the deck was actually under water. Her crew numbered 200, and as the crews of sealers and whalers work partially on the co-operative principle—that is, they are paid according to the value of the cargo—each of the ordinary seamen received upwards of £39. The Dundee seamen receive £2 10s. per month, with 2s. 6d. per ton "oil money," so that, supposing the vessel gets enough to make 100 tons, each man would receive for his trip the sum of £16. The European sealers do not generally carry such large crews, and the return per man is usually less. In the previous year (1871) the Newfoundland sealers took about 231,000 seals, making an average of 21,000 each, the largest for many seasons. Most of them made two trips. In 1865 the twenty-two British vessels captured 103,799 seals. In 1866 twenty-three vessels took 81,238. In 1867 twenty-six vessels took 96,615. In 1868 twenty-eight vessels took 52,486. In 1869 twenty-four vessels had 63,313. In 1870 the number of vessels engaged was twenty-

EXPLOREES DISTURBED BY WALRUS.

four, but they brought to the port 128,228 seals, and in 1877, to go no later, thirteen steamers obtained 76,000. In less than a week the *Arctic* had 15,000 on board, and the *Esquimaux* 14,330, though the season had not then finished. On the other hand, cases are by no means unfrequent in which vessels will cruise around—penetrating this “lead” and that “bight,” coasting here and there, suffering all the hardships of an Arctic spring—and yet not capture a single seal. The sealing, like the whaling, does not now occupy the same number of men it formerly did. This is greatly owing to steamers being more employed than before. Fifteen years ago, 15,000 men were employed in sailing vessels; now little more than half that number are so occupied. On the other hand, the “hands” on board the steamers in the Newfoundland seal trade—it is of these we speak—number about 8,000. It is calculated that on the extinction of the sailing fleet, only about 5,000 men will get berths. The value of seals varies with their species, size, and general condition. The young saddleback will weigh from forty-five to sixty pounds, while the old female of the same species will weigh from seventy to ninety pounds, and the male from ninety to 150 pounds. The ground seal, or “square flipper,” as the Newfoundland sealers call it, will sometimes weigh as much as 650 pounds. This includes skin and fat alone, for the carcase is of no use, and is always allowed to lie on the ice, to be the prey of the bears or white foxes, and finally to go to the bottom. The bed of the “sealing grounds” must be perfectly paved with phocine skeletons. The price the seals bring varies also according to the demand for oil and skins: 35s. per cwt. is a good sum for young saddlebacks, while the others rank at about 2s. per cwt. less. When the seals have arrived at the maximum fatness, eighty generally yield a ton of oil; otherwise the general average is about 100 to the ton—(i.e., 252 gallons wine measure; weighing, at a temperature of 60° Fahr., 1,933 lbs. 12 oz. 14 dr. avoirdupois). A few years ago good oil was selling at £33 per ton; add to this the value of 100 skins at 5s. each, and the whole value of 100 seals would then amount to £58 sterling. That is the calculation received from Dundee, the first mentioned being the one made in Newfoundland. The average catch of seals in Newfoundland for the last twenty years has been about 350,000 annually. In 1873, 463,531 seal-skins were exported. The number obtained by the vessels in the European fishery is usually much less; perhaps among them all an average of 200,000 per annum would be thought rather over than under the mark. This does not, of course, include the number killed by the wild Eskimo—which cannot be ascertained—or by the civilised Greenlanders—the latter killing, according to Dr. Rink, about 89,000 seals, and 700 white whales and narwhals every year. Seal-hunting is of great antiquity. It is said that some of the old Icelandic sagas, or romantic histories, were written on seal parchment. The German warriors who confronted the Roman legionaries were clothed in seal-skins, and the Roman military tents were at one time also constructed of the same material. It was believed to be so sure a talisman against lightning, that Augustus always wore a piece upon his person to act as a safeguard against what he so dreaded. In the North, eables were made of seals’ and walrus’ hides, and the Finns and Lapps paid their tribute in them. The old Icelandic colonists in Greenland paid their Peter’s pence in the same material; and a receipt is still in existence showing that their contributions to the Crusades were paid at Bergen in 1327 in sea-horse tusks. The flesh of some of the species is excellent. The Eskimo live almost entirely upon it, as do also

the Danes in Greenland. The writer, during his residence in that country, also ate it repeatedly, and, like most other people, learned to like it.

The hunting of the morse, walrus, or sea-horse (*Trichechus rosmarus*, p. 81), if not so important commercially, is even a more exciting pursuit than that of the seal. The walrus is widely distributed over the entire Arctic regions, round the whole circuit of the Polar basin, and extends at least to the southern extremity of Behring Strait. It is essentially a coast animal, and one found in shallow waters. It is never to be seen out on the high seas or more than a short distance from land. Little is known of its habits during the winter, but it is the belief of Mr. Lamont—who, of all Englishmen, is probably best acquainted with the habits of this great seal, for such it is, and to whose observation the following pages owe almost everything of value—that they congregate in vast numbers at that season about the south-west edges of the great ice-packs of Novaia Zemlia and Spitzbergen. A walrus is now and then found floating in the open sea, on a fragment of an ice-field; and it is to this accidental migration from its usual haunts that we owe its occasional presence in the north of Norway, and even in Shetland, Orkney, and the west of Scotland, to which the few killed in these localities have apparently swam, as the nearest land, after their ice-rafts had broken up. It is even believed that as late as the fifteenth century it was a regular visitant to our shores, and that the ivory ornaments of the ancient Britons' horse-trappings and weapons were carved from the sea-horses' tusks. As the ice breaks up in the spring the walrus move with it, and congregate together in troops, and finally go ashore in some rocky bay, where they may be sometimes found in thousands. Here, towards the end of August, they remain in a semi-torpid condition, neither moving nor feeding.

When found away from the coast it is necessary for the walrus to frequent shoals in order to obtain the shell-fish which constitute the principal part of its food. Its general appearance may be learned from our figures (pp. 28, 81). The most salient features in its portraiture are its gnarled hide, its whiskers the thickness of crow-quills, and its two great ivory tusks, or canine teeth, in the upper jaw. Its broad grinders enable it to crush the shells of the mollusks on which it feeds, and it is difficult to say what use it makes of its tusks, unless to stir up the mud in which its food is found, or to enable it to raise itself upon the ice. It is, however, these tusks and its coarse hide which render it valuable in commerce. Its flesh is eaten by the Norwegian and Siberian hunters, and by the Eskimo, but in the eyes of traders is of no value, and is not brought to Europe. On the floes over soundings and shoals the walrus often accumulate in immense numbers, and lie huddled upon the ice. More frequently in Davis Strait and Baffin's Bay they are found floating about on pieces of drift ice, in small family parties of six or seven; and in my voyages in those parts I have not unfrequently met a solitary hermit lying asleep on the ice all by himself. Whether in large or small parties, one is always on the watch, as was noticed long ago by the sagacious Cook. The watch on the approach of danger will rouse those next to it, and, the alarm being spread, presently the whole herd will be on the alert. When attacked, unlike other seals—unless it be the bladder-nose—it will not retreat, but boldly meet its enemies. I was one of a party in a boat which harpooned a solitary walrus asleep on a piece of ice. It immediately dived, but presently arose, and, notwithstanding all our exertions with lance, axe, and rifle, stove in the bows of

the boat by tearing the planks asunder with its powerful tusks. Indeed, we were only too glad to cut the line adrift, and save ourselves, by taking to the ice which the walrus had left, until assistance could reach us. Luckily for us, the enraged morse was magnanimous enough not to attack its chop-fallen enemies, but made off, grunting indignantly, with a gun harpoon and a new whale-line dangling from its bleeding flanks. Its *atluk*, or breathing-hole, is cleanly finished, and not unlike that of the seals, but in much thicker ice. It will devour,

VIEW OF SANDERSON'S HOPE, NEAR UPERNIVIK, BAFFIN'S BAY, 3,300 FEET HIGH. (From an Original Sketch.)

also, the carcasses of floating whales, for the stomach of one killed by us close to where a whale had been "flensed" was found crammed with the "krang" of the departed ectacean. In its stomach and around its *atluk* are generally found stones—a fact which is also true of the digestive apparatus of the ground seal and the white whale. Next to man its chief enemy is the Polar bear. It is easily domesticated, but has only been once or twice brought to England. One which I saw on board a whaler would follow its favourites about like a dog. It was, however, easily incensed. Its food was chiefly pea soup, and anything else which it could get. It survived for nearly three months, but not long enough to allow its "Awook! awook!" cry to be heard in the London Zoological Gardens. It is to this cry of "awook!" that the Eskimo name for it (*awook*) is due.

From the earliest period it has been determinedly hunted. Old Othere, the first sailer

beyond the North Cape, "hunted the walrus and the seal" in the White Sea. From that date, and probably long anteriorly, the war of extermination has been going on in Spitzbergen and Novaia Zemlia, until now the Norwegian walrus hunters have to direct their vessels far into the Kara Sea in search of their prey. Few, if any of them, now winter either in Novaia Zemlia or Spitzbergen with a view to more easily hunt their prey: they depend upon the success of their summer work. Year by year their fierce quarry is escaping

RECREATION IN THE ARCTIC REGIONS

to more and more inaccessible localities; and most probably this ruthless persecution which the walrus have undergone has altered its habits greatly. It is rare now-a-days, even with the aid of steamers, to hear of such a windfall as the slaughter of a whole herd. If they be killed in great numbers in one place, it is almost certain that they will not be found there in the following season. They will have made a prudent retreat to less easily reached haunts, where possibly, in future times, the species will be preserved, when it is no longer possible to derive either sport or profit from its slaughter. In the sixteenth and seventeenth centuries—though it had then been hunted by Dutch,

English, Norwegians, and Russians—they were described as “lying like hogges upon heaps” on Bear Island, south of Spitzbergen. Captain Thomas Edge, in 1616, killed in East Spitzbergen no less than a thousand. In other parts of the world they were equally numerous. For instance, in Lord Shulldham’s day they assembled on the Magdalen Islands, in the Gulf of St. Lawrence, to the number of 7,000 or 8,000, and sometimes as many as 1,600 were killed at one onset by the hunters who pursued them. When Marten visited Spitzbergen, it was possible for a ship’s crew to kill 900 in seven hours on Cherry Island.

The walrus is generally harpooned like the whale, and then killed by lances while swimming. Sometimes they are enticed within shot by having a *junger*—or young one—on board, or by using an instrument which, like the deer-call, simulates the cries of the young in distress, and so attracts the mother until she is near enough to be attacked. “Many men I have conversed with,” writes Mr. Lamont, “have averred that there is no more successful trick in the trade than to secure a ‘leetle-boy walrus,’ and, by prodding him up with the butt-end of a lance, elicit the plaintive barks which cannot fail to appeal to the clannish instincts of any walrus within hearing. I remember on one occasion, some years ago, falling in with a herd of walruses in the water. The mode of attack was to endeavour to harpoon them, by dint of hard rowing after the herd, as they alternately dived and swam on the surface to gain breath. If there are calves in the herd, they cannot go much faster than the boat, if so fast; and the calves having to come up to breathe much more frequently than the old ones, the whole herd generally accommodate their pace to that of the old cows with young ones. In all my sporting experience, I never saw anything to equal the wild excitement of such a hunt. Five pairs of oars pulled with utmost strength make the boat seem to fly through the water, while, perhaps, a hundred walruses, roaring, bellowing, blowing, snorting, and splashing, make an acre of the sea all in a foam before and around her. The harpooner stands with one foot on the thwart, and the other on the front locker, with the line coiled in his right hand, and the long weapon in both hands ready balanced for a dart, while he shouts to the crew which direction to take (as he, from standing upright in the boat, has a better opportunity of seeing the walruses under water). The herd generally keep close together, and the way in which they dive and reappear again simultaneously is remarkable; one moment you see a hundred grisly heads and long gleaming white tusks above the waves: they give one spout from their blow-holes [nostrils], take one breath of fresh air, and the next moment you see a hundred brown hemispherical backs, the next a hundred pairs of flippers [paws] flourishing, and then they are all down. On goes the boat, as hard as ever we can pull the oars, up come the sea-horses again, pretty close this time, and before they can draw breath the boat rushes into the midst of them; whish! goes the harpoon; birr! goes the line over the gunwale, and a luckless junger, on whom the harpooner has fixed his eye, is fast; his bereaved mother, snorting with rage, charges the boat with flashing eyes; she quickly receives a harpoon in the back and a bullet in the brain, and hangs lifeless on the line; now the junger begins to utter his plaintive grunting bark, and fifty furious walruses close round the boat in a few seconds, rearing up breast high in the water, and snorting and blowing as if they would tear us all to pieces. Two of these auxiliaries are speedily harpooned in their turn, and the rest hang back a little, when, as bad luck would have it, the junger gives up the ghost, owing to the severity of his harpooning, and the others, no longer attracted by

his cries, retire to a more prudent distance. But for this untoward and premature decease of the junger, the men told me we should have had more walruses on our hands than we could manage. This curious clannish practice of coming to assist a calf in distress arises from their being in the habit of combining to resist the Polar bear, which is said often to succeed in killing the walrus; if, however, Bruin, pressed by hunger and a tempting opportunity, is so ill-advised as to snatch a calf, the whole herd come upon him, drag him under the water, and tear him to pieces with their long sharp tusks." A hunter told Mr. Lamont of such a case. The bear was pulled under the water, and "nothing of him came up again, but small scraps of skin with white hair on them."

A still more remarkable case was related to him—namely, of the skipper of a ship, who had been seized by a bereaved cow walrus, and by her dragged twice to the bottom of the sea, without sustaining any other injury beyond being nearly drowned, and receiving two deep scars on his temple from her tusks. He thought the walrus did not wish to hurt him, but mistook him for her calf, as he floundered in the water—an excuse highly creditable to the captain's confidence in the kindliness of the walrus, but not altogether complimentary either to his own appearance or to the animal's intelligence!

No animal displays more maternal affection than the walrus. Cases are not uncommon in which a cow-walrus will hold her young one under one of her flippers, and interpose her own body between the harpooner and her offspring. They are also combative, and will use their tusks against one another, in the same way that game-cocks use their beaks. Contrary to what might be expected, from their unwieldiness, the walrus can not only strike downwards, but turn their necks with great facility and quickness, and strike either upward, downward, or sideways, with equal dexterity. Mr. Lamont has frequently seen them fighting with great ferocity on the ice; and the skins of the old bulls, which are light-coloured and nearly devoid of hair, are often covered with scars and wounds received in these encounters. Their tusks are firmly embedded for six or seven inches in the skull, which is itself so thick that an ordinary musket-bullet will flatten on it. A good pair of bull's tusks may be estimated at two feet in length, and four pounds apiece in weight. Sometimes, though rarely, they will measure thirty-one inches in length, and weigh as much as eight pounds each. Cows' tusks will average fully as much as bulls', but, from their liability to be broken, they are seldom more than twenty inches long, and three pounds each in weight. It is a common belief among the hunters that those walrus which have wide-set tusks are the most savage and dangerous, and more particularly if the tusks diverge from one another in *curves*, as is occasionally the case. The ivory of these tusks is extremely hard, dense, and white. Their small size, however, renders them inapplicable for many of the ivory-turner's purposes, and accordingly they do not command so high a price as elephant's ivory; but they are in good repute for the manufacture of false teeth, and for making chess-men, umbrella handles, whistles, and other small articles. The hides are used to make machine bands, and are employed in various other arts, for which a strong quality of leather is required. The walrus yields an enormous quantity of fat—sometimes between seven hundred and eight hundred pounds. The flesh is very welcome to hungry men, and the tongue particularly so; indeed, among some of the Baffin's Bay and Behring Straits whalers,

salt walrus tongue is a favourite dish. The Eskimo hunt the walrus by harpooning, but the South Greenlanders hesitate to attack it in their kayaks. *Awook* is their lion, and they always speak of him with the most profound respect. The wild denizens of Smith's Sound, however, though—owing to the want of kayaks, or boats—unable to attack the walrus in the water, boldly harpoon him as he lies on the ice-floes, and so supply to their families the food, warmth, and light which make tolerable the long Arctic night. The walrus is, indeed, the most formidable-looking animal in the Polar lands. From nine feet to sixteen feet in length, weighing about twenty hundredweight, encased in a coat of mail, in the shape of a skin two or three inches in thickness, his head crowned with

NARWHAL.

igly large eyes, and formidable tusks, surrounded at the base by coarse bristles, he is sufficiently demoniacal in appearance to suggest in the superstitious mind of the dweller in high latitudes a wholesome dread of him. According to them, he is under the protection of a walrus-deity, whose roars, far from beyond the lands which come under their ken, they affect to hear in terror, sounding through the aurora-lit winter night. The whales of the Arctic regions are many, and though all of them are more or less hunted by the Eskimo, there is only one—viz., the right whale, or mysticete (*Balaena mysticetus*)—which is of great economic value. The narwhal, or sea-unicorn (*Monodon monoceros*), about sixteen feet long, and armed with a long, straight horn-like spiral ivory tooth, sometimes ten feet in length, is one of the most remarkable of the Arctic cetaceans, as well as one of the most beautiful. This "horn" is, in reality, one of the canine, or eye-teeth, of the whale developed straight out, just as those of the walrus are bent downwards. However, while the teeth of the walrus are invariably developed in pairs, the horn of the narwhal is usually single, though in some cases both are protruded. These horns are greatly

valued for the purposes of the ivory-turner. At one time they were used in medicine, and cups made of them were believed to possess the power of detecting and neutralising any poison contained in them. To this day the Chinese esteem these horns for their medicinal properties. In old times it was supposed to be the horn of the fabled unicorn, and sold at enormous prices. In the Palace of Rosenborg, in Copenhagen, is a throne of the kings of Denmark, manufactured out of the ivory; and the father of Dr. Scoresby had a bedstead made out of them. In 1861 the price of narwhal's ivory

FALLS OF THE BRUARÍ, ICELAND.

was 1s. 6d. per pound, but of late years it has risen prodigiously in value, owing to its being in request for the repair of the Chinese palaces, but it is again falling. The oil is highly esteemed, and the flesh is very palatable, though, indeed, the learned Wormius warns us that it is a deadly poison. The skin of the narwhal, boiled to a jelly, is looked upon, and justly so, as one of the prime dainties of a Greenlander. The hospitable Danish ladies resident in Greenland always make a point of presenting a dish of *mattak* to their foreign visitors, who are, however, sufficiently rare not to make great demands on their culinary skill, and in most cases, of tastes cosmopolitan enough to appreciate the outlandish luxuries set before them.

The white whale (*Beluga albicans*) is probably of even more importance to the Eskimo than the narwhal. It is equally common, and its habits and migration are much the same

as those of the latter, which again follows the right whale in its migrations. It goes as far north as 78° at least. It wanders, however, further south than the narwhal, being found as a regular denizen in the St. Lawrence River. The Greenlanders, during the summer, kill great numbers of them, preserve their oil, and dry their flesh for winter use. Of this animal and the narwhal about 500 are yearly caught in Greenland by means of strong nets, or are harpooned, but the majority of them are white whales. It is about sixteen feet in length, and derives its common name from its creamy-white colour. It is a rare occurrence for the whalers to kill one, its swiftness and activity giving them more trouble than the oil is worth. They are sometimes called "sea-pigs," from their bearing some resemblance to that animal when tumbling about in great droves on the water.

The porpoise, dolphins of various species, and several species of fin whale, make up the other Arctic cetacea. The fin whales—so called from having a fin on their backs—are the largest known cetacea, often exceeding 100 feet in length, while the right whale rarely exceeds sixty; they are killed by the Eskimo, but not by the whalers. Their swiftness and fierceness render their pursuit difficult, while their thin, hard cartilaginous blubber—not unlike soft glue—yields little oil, and the whalebone in their mouths is short and all but worthless. They mostly belong to the genus *Balaenoptera*, and are known to the whalers as "finners" or "rorquals." They are almost equally common on our coasts during the herring-fishing season. They also frequent the cod banks, their large throat, unlike that of the right whale, permitting them to swallow great gulps of fishes at one mouthful.

The right whale (*Balæna mysticetus*) has been long pursued for the sake of its blubber and whalebone. The whales killed in the Middle Ages by the Basque whalers in the Bay of Biscay are, however, believed to have been a different species. As the range and migration of the present species will be more fully narrated in the succeeding chapter, we may be brief in our description of this, the most important of the Arctic "sea monsters." Its throat is so narrow that it cannot live on fishes, but on *Clio borealis*, a small mollusk found in abundance throughout the Polar regions, and on the little shrimp-like *Cetochilus arcticus*, and its relatives. These animals again live on the minute microscopic plant called the diatom, which discolours, of a green hue, great portions of the frozen seas. *Clio* and the entomostraca, therefore, are chiefly found in these places. The whale frequents the localities where its food is most abundant, and the whaler sails with all haste from one feeding-ground to another in search of it. It is, therefore, no exaggeration to affirm, as I did some years ago, in another place, "that in all the annals of biology I know nothing stranger than the curious tale I have unfolded: the diatom, staining the broad frozen sea, supporting myriads of living beings which crowd there to feed on it, and these, again, supporting the huge whale; so completing the wonderful cycle of life. Thus it is no stretch of the imagination to say that one of the greatest animals in creation*—whose pursuit gives employment to many thousand tons of shipping and thousands of seamen, and the importance of which is commercially so

* Nilsson, in his "Skandinavisk Fauna," vol. i., p. 643, estimates the full-grown *B. mysticetus* at 100 tons or 220,000 lbs., or equal to eighty-eight elephants or 440 white bears.

great that its failure for one season was estimated, for one Scottish port alone (Dundee, in 1367), at a loss of £100,000 sterling—depends for its existence on a being so minute that it takes thousands to be massed together before they are visible to the naked eye, and, though thousands of ships for hundreds of years sailed the Arctic, unknown to the men who were most interested in its existence; illustrating, in a remarkable degree, how Nature is, in all her kingdoms, dependent on, and how great are, little things!"

The gun harpoon (a harpoon fired out of a huge horse-pistol-like weapon, mounted on swivels in the bow of the boat) has now almost entirely superseded the old hand harpoon. It is, however, still believed that the latter, if more difficult to use, is a more efficient weapon. After the whale is "struck," it generally dives or makes for the nearest ice, among the frozen fields of which it is sometimes lost. The boat which is "fast" hoists a flag, when the other boats come to its assistance. If the whaler is "paying out" much line, they unite their lines to the first one. When it comes up to breathe, the other boats either harpoon it afresh, or, if it is weakened, lance it; for the harpoon acts merely as a hook, the whale being killed by the long steel lances. When killed, the boats tow it alongside the vessel, where, by a contrivance of cords and pulleys, it is secured, and turned gradually round to permit the blubber being taken off it, and the whalebone strips cut out of its upper jaw. The blubber is then put into iron tanks with screw tops, or if these fail, into casks, which are taken out in staves, or "shakes," and put up by the cooper as occasion requires. The oil is fried out after the ship comes home. The ways of life of a whaler we may have occasion to describe when, in a future chapter, man in the far North is sketched. The whales are being gradually driven further and further to the northward; but the varying fortune of the whaling trade is as much owing to the ill luck of the whalers in coming across their haunts as to the want of whales. I am not at all sure that they are decreasing so greatly in numbers as is the general belief. Every now and again cargoes equal to anything that was obtained in the best days of the trade are procured. In 1861 I came home to England, "shipmate" (as the phrase goes) with no less than thirty right whales, in addition to a miscellaneous menagerie of Arctic animals, dead and alive, and a motley human crew—a company so *outré*, that I question if ever naturalist, or even whaler, sailed with the like before. No doubt, many of the whales were only half grown, or even younger; but still, the cargo was a monster one. The whales of the Sea of Okotsk and Behring's Strait are said to be different in species from those of the North Atlantic. They are, however, as yet very imperfectly described, and it is known that whales harpooned in Baffin's Bay have been afterwards killed in the North Pacific, having accomplished the "North-west Passage." The common porpoise is also common to both seas.

The white bear (*Ursus maritimus*) is one of the best known of the Arctic land animals. It ranges both sea and land in search of its prey, but its favourite food is seals, for which it ingeniously lies in wait and attempts to circumvent. It is still common in most parts of the Arctic regions, but of late years has been almost exterminated in Middle Greenland. It will often be found far from land; and during the sealing season it is a constant attendant on the sealer, for the sake of the carcasses, in pursuit of which it is more free than welcome. It is a powerful animal, often weighing from ten

to twelve hundred pounds. It will also in the summer vary its diet by a feast of eggs. It will even eat seaweeds in the last extremity of that hunger to which it is often driven. The smell of burnt fat will attract it for miles, and though, as a rule, it will run before man, yet it is by no means an enemy to be despised.

The Arctic fox (*Fulpes lagopus*) is another widely-spread Arctic animal. Like the bear, it also leaves the land to search for its food, though it confines itself to the ice-field, and does not take to the water. It will often be seen hundreds of miles from land during the sealing season. When in pursuit of the wandering lemming it sometimes loses its way home, and has been taken in places far from its natural haunts. There are two varieties, the blue and the white. The former is much more valued for its fur than the latter, a single skin often fetching £3 in the European markets. Both cast their coats during the summer, and become brown. At that period it is rarely killed, its fur being of little value. It is then found in the mountains, preying on the young ptarmigan; in winter it comes down to prey on shell-fish and other marine produce, at the open places near the shore when the tide breaks the ice. About this time it can often be seen barking its "ak! hak-a!" most impudently at the solitary hunter. It is not a retiring animal by any means. When the hunter returns from his day's labour it is one of the first unannounced visitors which come either to share the produce of the chase or to plunder his provision bag. It accompanies him—at a respectful distance—on his sledging or other expeditions, and rewards itself for this unasked attention by purloining whatever it can obtain. If fired at, it will simply, if unhurt, bark at its assailant, and retreat reluctantly.

The snowy-white hare (*Lepus glacialis*) is one of the most beautiful of Arctic animals, and though it differs from the European blue hare in very few characters, is in habits widely different. The "timid hare" is with us a proverb; but in the Polar regions, its cousin is, on the contrary, fearless of man; it will sit "as if nailed in its rocky refuge," however near the hunter may pass it. The German Expedition to East Greenland described certain places in that country—on mountain slopes—as being dotted with white spots, which, on examination, proved to be hares. Often after missing a hare, the hunter has been enabled—so careless is it—to take out his note-book and sketch it in various attitudes, while it was quietly nibbling the moss, and then at his leisure shoot it. Its hair is sometimes used by the Eskimo to weave thread, out of which they make children's caps. Its flesh is very insipid.

The wolf—not the "grey beast of Pyrenean snow," but a species peculiar to high latitudes (*Canis lupus*, var. *albus*)—is unknown in Arctic Europe or in East Greenland. It has, however, once been killed in West Greenland, having crossed over the ice from the opposite shore, where it is common. It is very like the Eskimo dog, which is, in all likelihood, only a long-tamed wolf. This dog and its use in dragging the sledge we have already spoken of.* It is now rapidly being decimated by disease both in Greenland and

* In Rink's work, already referred to, the fullest particulars may be obtained regarding dog-sledging, and ample information concerning recent explorations in Greenland, with a Flora by Prof. Lange, will be found in the six beautifully-illustrated volumes, entitled "Meddelelser om Grönland" (1879-1883), and in the seventh volume of Heer's "Flora fossilis arctica" (1883). From not clearly understanding some of my descriptions, Mr. Steenstrup has, however, fallen into certain errors, which are corrected by me in "Science" (Boston, U.S.A.), No. 37, Oct. 19, 1883, p. 539.

HUNTING THE MUSK-OX (*Ovibos moschatus*).

in Kamschatka. This disease is akin to hydrophobia, but differs from that complaint in many particulars. "Stamping out" is the only cure (*sic*) yet suggested for it.

The Arctic lemming is a variety of the Lapland and Norwegian species. In East Greenland it is common in the vicinity of Scoresby's Sound and the winter quarters of the German Expedition (75° North lat.). Southward it seems unknown, and does not appear again in West Greenland, until we reach the upper part of Smith's Sound. This curious distribution shows that most likely there is a route by which animals can travel around the northern end of Greenland to the east coast, or that, far to the north, the great interior inland ice is interrupted. We will see presently that the musk-ox has a similar distribution as well as the ermine, which, unknown in South Greenland, either on the east or west, is found on the far northern part of either coast. It is unknown in Spitzbergen, but exists in Novaia Zemlia, and, like the lemming, is abundant in Hudson's Bay and almost every other part of the Arctic region. The Hudson's Bay lemming (*Myodes torquatus*, var. *hudsonius*) is, however, a different variety.

The musk-ox, or properly, the musk-sheep (*Ovibos moschatus*), is another of the Arctic animals, but is altogether confined to Arctic America and to a very local range in Greenland. It is rather smaller than the average European ox (Fig., p. 93). Its threatening appearance quite belies its harmless character. It is black in colour, with long hair falling in rough manes, though on its back is fine wool. As its name implies, its flesh and fat are musky in odour; but on the whole they greatly resemble those of the domesticated ox, and when young its meat does not differ greatly from the best beef. Like the reindeer, it is usually met with in herds—rarely exceeding from 100 to 200 in number. When first the musk-ox sights the stranger it remains as if rooted to the spot, "staring at the strange unknown enemy, and arrives very slowly at a resolution." Its head is its invulnerable part: a bullet will flatten on it. "If a family, or herd with young ones," writes the historian of the German Expedition, "are surprised, they either form a square (the young being in the centre and the old outside, with their heads down), or else the bull, placed as a sentinel, takes to flight, and the others follow closely, the placing of their outposts being astonishing. They are also excellent climbers. A retreating herd climbed a snow path, at an incline of not less than 45°, on a high mountain near our winter harbour, and, to our great astonishment, we saw one looking down on us from between the craggy walls of Cape Hamburg." On the top of Cape Franklin, at a height of 4,875 feet above the sea-level, and on the back of the Hasenberg, at 1,950, traces of this strange sheep-ox were observed. At one time it was believed to be entirely unknown in Greenland. It was, however, found in abundance near the German winter quarters, in about 75° north latitude, and by Hall at a few degrees further to the north in Smith's Sound. South of these limits it is unknown in Greenland, though, curiously, the Eskimo in that country still call the domesticated ox by the name of the musk-ox, viz., *Ummingmak*.

The reindeer (*Rangifer tarandus*) is one of the most characteristic of Northern animals. (Fig. p. 96.) It is found over the whole range of the Arctic regions, stretching further to the south than most other Polar animals; and though there are varieties, yet the distinctions between these varieties in America, Greenland, Lapland, and Spitzbergen are so trifling, that we may look upon them as all one species. In no portion of Greenland or America is it

tamed as in Lapland, the north of Russia, and Siberia. In Iceland, though not a native of that island, it is found in abundance, having been imported into the country from Norway by Governor Thodal, in 1770. It is not, however, tamed, but runs wild in the interior in great herds. In Lapland it is a domestic animal. The Lapps breed it, and pasture it in great flocks; it is their sole wealth—their dreary, mossy wilds or lichen-clothed forests yielding little food. To them it is, at once, the cow which yields milk, butter, and cheese, and the beast of burden which drags their sledges—"their ox, their ass, their everything." Its skin supplies the Lapps with clothing, and when old or infirm its flesh is valued as food. Moreover, it is to the dusky traveller in the north of Europe not only a faithful servant, but even an uncomplaining companion. It feeds on lichens, mosses, willows, buckbean, and other dwarf Arctic vegetation, and in the winter will dig under the snow for the scanty herbage: this, during the winter in Norway, consists almost entirely of the reindeer-moss (*Cladonia rangiferina*). These animals are found in immense numbers in Spitzbergen, and Mr. Lamont considers that at some time they must have passed over the ice and intermediate frozen lands to Spitzbergen from a point of the continent of Asia almost exactly opposite. Some of them were killed, with ear-marks, such as the reindeer herdsmen sometimes put on them. Often in Eastern Siberia herds of tame reindeer stray away, and are said to go over the ice and be never seen again.

In Greenland they are also found in vast numbers, and are very recklessly slaughtered by the Eskimo. Their skins are worth in Copenhagen from 6s. 9d. to 15s. 9d. each, according to the quality, though the natives get only 1s. 6d. for them. The yearly number killed used to be, in the summer, from 10,000 to 20,000, but it is now on the decrease. During the early summer the reindeer in Norway descend from the sub-Alpine pastures for the purpose of feeding on the sweet young grass springing up; but in the hot weather, like deer generally, they return to the higher regions, to avoid persecution by a species of breeze-fly (*Eristrus tarandi*), which lays its eggs, covered with an adhesive substance, on the back of the deer's neck. The larvæ, when hatched, burrow their way beneath the skin, and form a considerable swelling. The American "caribou," or reindeer, frequents densely-wooded districts, as well as extensive "pine barrens" and open places, while the Scandinavian reindeer more affects mountain regions. Formerly, great numbers of wild reindeer were captured in Norway by means of pitfalls—usually constructed in some narrow rocky place through which the deer were compelled to pass. These pits were called *Rengrave* (reindeer graves), but by the Norwegian game laws they are now compelled to be filled up. They were covered with sticks, over which a thick layer of moss was spread; of course, as soon as the deer trod on the treacherous ground it was engulfed, and from the narrowness and depth of the pit, found it useless to struggle to escape.* Sir John Richardson describes an ingenious plan of capturing the American caribou, as practised in Chesterfield Inlet. The sides of the trap are composed of blocks of snow; an inclined plane of snow leads to the entrance of the pit, which is about five feet deep, and of sufficient dimensions to contain three full-grown deer. "The pit is covered with a large

* Austen, in Lartet and Christy's "Reliquiæ Aquitanicæ," p. 217.

thin slab of snow, which the animal is enticed to tread upon by a quantity of the lichens on which it feeds being placed conspicuously on an eminence beyond the opening. The exterior of the trap is backed up with snow, so as to resemble a natural hillock, and care is taken to render it so steep, on all sides but one, that the deer must pass over the mouth of the trap before it can reach the bait. The slab is sufficiently strong to bear the weight of a deer until it has passed the middle, when it revolves on two stout axles of wood, precipitates the deer into the trap, and returns to its place again, in

REINDEER (*Rangifer tarandus*).

consequence of the lower end being heavier than the other." The Eskimo likewise kill them by spearing them from their kayaks as the deer are crossing lakes or inlets on their annual migration southward. Mr. Austen also describes another ingenious device adopted in Russian Finland and some parts of Lapland to capture the reindeer. It is called the "Vild Ren Hage." A kind of fence, about two miles long, is constructed of small trees, matted and interlaced with brushwood; openings are left at intervals, about three feet in width, and stout posts are driven into the ground at each side. "To one of these is attached a strong noose, made of thick rope, which is retained in a circular form by means of very slender twigs, which give way at the slightest touch; and to prevent the fawns from leaping through without entangling themselves, two threads are placed diagonally across it. It is said that when the deer meet with these hedges (which are usually made at the time of their partial migrations to the lower grounds, in

4 VIEW OF THE "DEVIL'S CASTLE," A GROUP OF ROCKS IN FRANZ-JOSEPH FJORD, EAST GREENLAND.

...ing) they proceed along them until they come to one of these openings, in forcing their way through which one of the number is usually entangled in the snare."

We have said so much about the larger Arctic animals, that if we are to keep this

ASSEMBLAGE OF PUFFINS, AUKS, AND OTHER ARCTIC BIRDS.*

part of our subject within due bounds, we must say but little of the Arctic birds and fishes. Some of the former we have already spoken of; and as most of them, if not all, are also feathered friends of lower latitudes, we may have occasion to meet them elsewhere.

* The Great Auk (*Alca impennis*), once a common bird in Northern Europe and America, is now believed to be entirely extinct. At one time it was plentiful in Newfoundland, Iceland, and elsewhere, but being unable to escape by flight, it seems to have been exterminated by man.

Taking Greenland as the type of the Arctic world as regards birds, we have, according to Newton, among the regular feathered inhabitants five species belonging to the Old World, eleven to the New World, and forty-five species common both to the Old and New Worlds. Among the stragglers, nineteen are Old World denizens, thirty-four New World, and eight common to both Old and New Worlds. In each category—inhabitants and stragglers—there are, respectively, one and two doubtful members. The fishes are not numerous, in Greenland alone only seventy-eight being at present known in the fresh waters and the surrounding sea, and it is not very likely that the number will be much increased. The only ones of economic importance are the little *Cottus scorpius*, or “kaniok,” which the old Greenlanders fish from rocks, the Norwegian Sea perch (*Sebastes norvegicus*), the lump fish (*Cyclopterus lumpus*), the halibut (*Hippoglossus vulgaris*), the different species of cod (*Gadus agilis* and *oak*), the salmon (*Salmo carpio*), the capelin, on which the dogs are sometimes fed (*Mallotus villosus*), and the Greenland shark (*Somniosus microcephalus*), the eye of which is usually infested by a parasite, which renders the fish blind. It is a constant attendant on the flensing of whales, but is very harmless. It is captured for the sake of the oil in its liver, out of which, it is said, a great deal of the “cod-liver oil” of commerce is made.

THE ANCIENT FORESTS OF POLAR LANDS.

As there were “brave men before Agamemnon,” so there were plants and animals in the world before the present ones which are on its surface and in its waters. The extinct ones are found embedded in its rocks. In the Arctic regions, as elsewhere, we find these in abundance. Most of the geological formations are found within the Polar regions. Thus in Smith’s Sound we have Silurian rocks, and in Greenland, Spitzbergen, and Mackenzie River miocene and cretaceous rocks also. In Bear, Barentz, and Melville Islands—wide apart as they are—there are carboniferous plants, identical with those found in the same formation in Britain. Meteorites are found scattered over the country with masses of iron, which there is every belief is of meteoric origin, though the fact has been doubted. Liassic rocks, with ammonites, and the bones of that great lizard, the *Ichthyosaurus*, are found about the Parry Islands and elsewhere. The bones of the mammoth, or woolly elephant, are scattered abundantly along the northern shores of Siberia. Mines are rare. Coal is generally found along with the miocene and cretaceous rocks, and though of poor quality, is combustible. Plumbago is common; traces of tin, silver, and copper have been found in Greenland, and the meteoric iron was at one time used by the Eskimo. But the most valuable “rock” in the Arctic regions is the cryolite, found at Arksut Fjord, in South Greenland. It is a white mineral, out of which soda and aluminium are extracted. The refuse is extensively employed in making the fine Danish porcelain, and in manufacturing excellent plate glass. The examination of the Arctic flora and fauna shows that the now frozen regions were once covered with luxuriant vegetation; and that while dwarf bushes and creeping willows now cover the frozen soil, tropical and semi-tropical vegetation formerly flourished. The miocene beds of Disco, Spitzbergen, and, indeed, the whole circuit of the Polar basin, show this in a remarkable manner; and though much of the material from which Professor Heer, of Zurich, described the remarkable plants—from the study of which he drew his

conclusions—was also collected by the writer and his companions, yet, as no more fitting words than those in which the famous Swiss palæontologist summed up the result of his researches can be found, this too brief and yet too long chapter may be concluded with them.

Speaking generally of the later deposits of the Arctic, he remarks that:—"At the period when the sandstones which compose the smiling hills of Zurich were deposited, a considerable extent of *terra firma* must have existed in the extreme north. To this period the name of miocene has been given, or more generally that of the Tertiary Period. Our countries had then almost a tropical character. Among the forests of laurels and the tufts of palm trees lived numerous animals, belonging to types which nowadays occur only in the warm and even torrid zones. Towards the north, indeed, the ground was clothed in a different vesture. Nevertheless, Greenland, even at 70° N. latitude, presents a flora which, by its climatic characters, may be compared with that of Northern Italy. This flora teaches us that in the neighbourhood of the Island of Disco and the Noursoak Peninsula there was once a lake of fresh water, upon the marshy edges of which great beds of peat were formed. These subsequently gave origin to the deposits of coal which appear along the coast. In our marshes it is not rare to see ferruginous water, which covers the soil with a reddish-brown crust. The same took place in the ancient marshes of Greenland: the iron deposited itself upon the plants which fell into the water, and these in their turn contributed to the precipitation and fixation of the iron. By this means has been gradually formed that ferruginous rock, in the bosom of which numerous plants are imprisoned. These fossils show that the marshes were covered with sedges and reeds; but the marsh cypress, the water pines, the birch, the alder, and the poplar flourished there: for numerous fragments of these plants are covered by a ferruginous deposit. The water trefoil (*Menyanthes arctica*, Hr.) no doubt grew in the marshes, in the same way that the existing species (*M. trifoliata*) adorns our moist meadows with its charming flowers; and the burr reed (*Sparganium stygium*, Hr.), the fruit of which has been obtained from the rocks, also formerly raised its bristling head above the waves. The rivulets also brought in leaves from other localities; they conveyed them from the primitive forests; and it is thus that we find their traces in the ferruginous rocks. If we enter into these forests, we shall see a marvellous profusion of trees and shrubs, among which we can distinguish forty-five different species. A tree with acicular leaves (*Sequoia Langsdorffi*, Brogn.) strikes us at once by its enormous proportions. It has left leafy branches in such numbers that there is scarcely a fragment of stone which does not contain its remains; and the remains which the hammer has extracted from the rock enable us to reconstruct the entire tree. It is accompanied by two allied species (*S. Couttsia*, Hr., and *S. longifolia*, Hr.), one of which (*S. Couttsia*), by the configuration of its branches and leaves, vividly reminds us of the *Sequoia gigantea* (*Wellingtonia*) of California. A *Thuja* had a different aspect, as also the ginkgo (*Salisburea borealis*, Ung.), of which the leaves resemble the fronds of ferns, and differ so widely from those of other Coniferæ. The leafy trees are especially well represented: while our existing forests present only two species of oak, North Greenland possesses nine, four of which are evergreen, like the Italian oak. Two beeches (*Fagus Deucalionis*, Ung., and *F.* sp. —), a chestnut (*Castanea Ungerii*, Hr.), two planes (*Platanus aceroides*, Gœp.,

and *P. Guillelmæ*, Gœp.), and a walnut (*Juglans acuminata*), from this forest, resemble the types of the same name known to everybody. Besides these, American species, such as the magnolias, sassafrasses, and liquidambars were represented there; and the characters of the ebony tree (*Diospyros*) are to be distinguished in two of the species. The hazel, the sumach (*Rhus*), the buckthorn, and the holly, the guelder rose and the white hawthorn (*Cratægus*), probably formed the thickets at the borders of the woods; while the vine, the ivy, and the sarsaparilla climbed over the trees of the virgin forest, and adorned them with garlands. In the shadow of the wood grew a profusion of ferns, which covered the soil with their elegant fronds. The insects which gave animation to these solitudes are not all lost. The impressions of these which have reached us show that little *Chrysomelas* and *Cistilidæ* enjoyed themselves in the sun, and large *Trogsitæ* pierced the bark of the trees, while charming *Cicadellæ* leaped about among the herbage. Since these words were written numerous additional species have been discovered, but the conclusions stated still remain unaltered.

CHAPTER V.

WHALING AND WHALERS OF THE NORTH.

"IN a pour of sleet and snow," we read in the newspapers, that the whalers *Camperdown*, *Narwhal*, or *Ann Elizabeth*, "sailed for the Greenland whale fishery." Such notices as this begin to appear about March, and disappear after the first days of May, all of the whalers having then left for their summer haunts. Now if many, indeed most people, were asked where they go, they would readily reply, "Oh! somewhere up in Greenland," a vague, and, as we shall have occasion to show, not altogether a very correct answer. When anything is said about whales and whaling, Scoresby and his "Arctic Regions" are abundantly quoted, for who is there who has not, in some form or another, seen the frontispiece affixed to that really valuable book of the whale tossing the boat, with its crew, high into the air, the boat being, however, rather larger than the whale, and the feat being one which it would be hardly possible for any created being—living or extinct—to accomplish! The artist has not, however, hesitated at trifles, and editors of boys' books are not likely to willingly let the celebrated illustration die for want of reproduction. It is now, however, many a long year since the "Arctic Regions" was published. Since then Captain Scoresby, the whaler—subsequently the reverend doctor—has slept with his fathers, and his book has almost disappeared from the catalogues. Whaling has also undergone many changes. No longer do any South Sea whalers sail from England, and the North Sea "fishery" is now reduced from the once large fleet to only a few vessels, starting entirely from Scottish ports. The vessels have changed too. No longer are they great, jolly, bluff-bowed "snuff-boxes," in which it was hard for the uninitiated to distinguish the stem from the stern. Smart vessels—novelties undreamt of in Scoresby's day—fitted up with all the appliances of modern science, have taken their place. The character of the crews, the captains, and of the very boats used has all changed. Even the *locale* of the fishery

has shifted. Instead of, as formerly, "Old Greenland" or the Spitzbergen Sea being the scene of the whaler's triumph and hardships, Baffin's Bay, the western shore of Davis' Strait, and the *Meta incognita* of old Martin Frobisher, are his haunts—familiar enough to many now, though all unknown land in those old pre-Russian days.

Dundee, Peterhead, and Aberdeen once had the monopoly of the British whaling, though year by year its limits have been so contracting that it is now concentrated in Dundee, the two latter ports having ceased to send out vessels. Without a single exception, the whalers are now screw steamers, built especially for this trade—the few sailing-vessels having every year decreased in number, being either sold or cut down in order to put engines into them, the advantages of steam being so apparent. Nearly all of them leave port about the end of February, and proceed north to the seal fishery, off the island of Jan Mayen, in the Spitzbergen Sea, described in the preceding chapter, calling at Lerwick, in Shetland, for extra men, and returning home again about the end of April if they propose proceeding to the Davis' Strait fishery. The one or two who remain in the old Greenland whaling cruise about the Greenland Sea until about August, when they return, the ice forming sooner in the high northern latitudes which they frequent than in the region of Davis' Strait. Most of the whalers, however, which visit "Old Greenland" are from Norway, Holland, or Germany, though there are still a few Scottish vessels, mostly owned in Peterhead, which, either from old custom or for the sake of making a shorter voyage, prefer this dreary hunting-field to the more popular one indicated.

FOR "THE STRAITS."

The Davis' Strait ships accordingly discharge what cargo of seals they may have on board, refill with coals and provisions, and by the beginning of May, at the latest, are on their way again for the Arctic seas. A voyage across the Atlantic, from Cape Wrath to Cape Farewell, though a couple of thousand miles, is at that season a mere holiday trip, as, indeed, an expedition to Greenland may always be, the amusing popular notion as to its hardships to the contrary notwithstanding. High seas are then rare, and calms are the chief annoyance of the whaler, for on the way out he uses his sails whenever possible, the necessary stowage space of his vessel permitting of only a small quantity of coal, for ice navigation, being carried. In a fortnight or three weeks from Cape Wrath he may be in the latitude of Cape Farewell, the most southerly point of Greenland, but I have met few Arctic navigators who have ever seen that promontory. Though I have doubled it four times, I never yet saw it, the reason being that there is generally a great ice-drift brought by the east coast current round the cape, so that, in order to avoid this, experienced mariners keep off to the westward, and rarely sight the Greenland coast much below Holsteinsborg. Here the east coast ice is jammed in upon the coast by the westerly current, which impinges on the coast at this point. Accordingly, until you get into high latitudes, the coast is clearer of ice north of this point than south of it. It is, in fact, always difficult to get into the South Greenland ports early in the year, and even at a later period. Vessels have been known to have been unable to get in there, and forced to sail again for Denmark without landing the stores or taking away the produce of the trading

posts. On the other hand, it not unfrequently happens that the annual ship is shut in by the ice, and is unable to effect her escape before the winter sets in. Such an untoward mishap befell the ships no later than 1875. An ignorance of these facts about the southern portion of Greenland being more ice-jammed at certain seasons than others has been a source of inconvenience to the only yachtsman who has yet ventured so far a-field, viz., Prince Napoleon. He hesitated to proceed further north than one of the most southerly settlements, while, at that season, he would have found the sea, as far as the limits of the Danish possessions at least, almost free from ice.

We are, however, proceeding a little too fast. It is not with imperial yachtsmen that this chapter is concerned, but with a hardier and humbler race of seafaring folk. Generally speaking—I dare say with exceptions—fully one-half of a whaler's crew is under the influence of strong waters just as the vessel is hauled out of dock. Knowing this—in Dundee at least—it is customary merely to drop down the Tay that night, and anchor until daylight and sobriety come in company. If the vessel be a steamer the services of the crew are not required, the "engineer's squad" being quite sufficient to get her beyond the boundaries of the port. The home-pilot is scarce well off the deck before we are in the Pentland Frith, where, as in Martin Frobisher's day, "two lusty fellows taketh us through," only that nowadays generally one sufficeth. The land fades away behind us; we may possibly, if driven a little out of our course, sight Rockall—that "solitary rock amid the main"—but more commonly the last of British land we see are the Flaunan Isles, or "Seven Hunters," and the islands of Barra and Rona, inhabited by a few families of fishermen, who are so isolated from the world that—honest folk—they prayed for George III. three months after his death, and are not yet remarkably sure under whose benign government they live.

"MAKING FREE OF GREENLAND."

We have scarcely done so, however, before the May-day saturnalia commence. I do not remember ever to have seen them described, so that I may spare a little space to these peculiar rites—the Arctic substitute for others more familiar in milder zones. For some days previously, a huge unwieldy-looking instrument, made out of rusty iron hoop into the shape of a razor, has been suspended in a prominent place. It is well notched here and there; and beside it is hung another piece of hoop, bent into the form of a rather rough pair of tweezers. A piece of chain, symbolical of after proceedings, bears the tonsorial instruments company. If not already initiated into the mysteries of it, the inscription chalked in very legible, if not elegant, letters, by the "scholars" of the "'tween decks," will give the neophyte a rather close suspicion of the uses and usages thereof:—

"ON MAY 1 AT 12 O'CLOCK PRESESLY BARBAR SNIP & NEPTUNE AND RETINU
WILL COME ON BOARD FROM LIFLY."*

The three utensils are supposed to be the razor, strop, and nose-holder, with which the neophyte—including, perhaps, the reader—is to be initiated into the art and mystery, and

* Lively or Godhavn, the familiar El Dorado of the Greenland whaler, afterwards mentioned.

received into the worshipful brotherhood of Arctic Navigators. True enough at twelve o'clock "presesly" (remember we are in a Scottish whaler), a most hideous noise commences. The bell commences "striking" furiously, Neptune is hailed from the ship and sea, and finally, amid much noise and trampling of feet, a procession comes down the companion-way, and an unearthly voice bawls through the speaking-trumpet into the cabin, "Captain, hae ye ony objections tae a sang frae Neptun' and his retinu?" With

GODHAYN, DISCO ISLAND. (After Markham.)

the licence allowed by long usage on such occasions, "Neptune and his retinue" make their appearance in the main cabin. It consists of the following not strictly classical personages:—Neptune (with a trident of tin, and a red herring stuck on the end of it), Madame Neptune (very loving, and—under the influence of a glass of rum—unbecomingly so), Neptune's doctor and mate (in pilot jackets, white collars, and ties of paper), Neptune's barber and mate, closed by the constable (in a real policeman's coat). The songs then commence, the choruses being vastly increased by the steward serving out the long-looked-for grog. Indeed, we can overhear Neptune, in a voice savouring of most ungodly words, wondering huskily to his spouse when the rum is likely to be forthcoming. The last of the ditties is one entitled, "Sister Mary," the air and words of which are, I dare

say—and not improperly—unknown to the Italian Opera, but of which the chorus contains the ominous refrain—

“For the time is drawing nigh.”

He is a very foolish man who would attempt to resist on these occasions, and accordingly all the “green-hands” connected with the cabin (almost invariably the surgeon, the steward, and possibly a stray naturalist who unthinkingly has taken passage northward) are marched off

WHALER WITH BOATS FAST TO A “FISH” (WITH THE GUN HARPOON).

by the constable and his men armed with broomsticks. Neptune is received by all the idlers in the ’tween decks, brilliantly lighted up, and draws lots for the order of precedence. Generally the “officer and gentleman” passenger, if anything of a favourite, is let off very lightly, the probabilities having been that already he has secured an almost entire immunity by sundry gifts of grog and tobacco in an early portion of the evening. The others are marched in successively—all blindfolded—amid blowing of trumpets and every conceivable noise and hubbub that can be conjured up on board a ship with a crew of seventy men, each more intent than the other on fun and frolic, the roughness of which is the chief element in it. We, of course, like unfeeling wretches as we are, sit round quite unconcerned, enjoying the trepidation of our comrades, proving to a demonstration the truth of Rochefoucauld’s bitter maxim, that every-

body rejoices in the misfortunes of his neighbour. The victim, seated in a roughly-improvised chair, and bound to the mizen-mast, is asked by his Majesty various questions, such as his name, was he ever here before, and so on. The barber's mate then proceeds to lather him well with tar and grease, the abominable mixture being well rubbed if it be seen that (as is usually the case among "knowing hands") the beard has been well greased beforehand to prevent the tar sticking. The barber then, with many time-honoured witticisms on the smooth beard of the gentle youth, proceeds to perform his function with the uncouth razor already described, courteously consulting him in a tone of ironical politeness regarding the particular style of whisker preferred. Ignorance is no bliss here, so the victim wisely keeps his mouth rigidly shut, knowing well that were it opened to answer any question, the penalty paid would undoubtedly be the entrance of the tar-brush, with many apologies for the barber's awkwardness. The "towel" is a wet ship's mop, not particularly clean, and with this the barber's mate is most assiduous in wiping the freshly-shaved chin. Meanwhile, the "doctor" expresses great anxiety for his health, feeling his pulse learnedly, and quoting with the most amusing absurdity the longest words which it has been possible for him to muster out of the patent medicine advertisements in the newspapers. Every effort is meanwhile being made to induce the victim to open his mouth, and here the nose-holders come in, their chief use (*sic*) being to prevent the poor wretch breathing by the nostrils, and so being compelled to open his mouth. Woe betide him! Instantly a pill composed of unmentionable materials is pushed into it, followed by a dash of some liquid (sea water or worse). He must finally, before being released, hail the ship three times through the speaking-trumpet, a rush of cold water being thrown down the speaking-trumpet the last time he opens his mouth to hail. The prisoner is then released, and declared free of the Greenland Sea, with all the honours, pleasures, profits, and immunities thereto pertaining. The same scene is gone through with the rest, the musician in the meantime playing doleful tunes on that not very hilarious musical instrument, the bagpipes. Considerable amusement is generally got out of some obstreperous individual who may be foolish enough to resist. Naturally, he fares all the worse, no one enjoying his misery more than those who five minutes previously were undergoing the same ordeal, displaying that savage zest which it is said the slave used to exercise over his fellow-negroes when elevated to the office of driver. Generally, however, all is given and taken in good part, the evening ending with a dance and other rougher fun sailor fashion. The stimulus of the grog being exhausted, those who are not "on the watch" "turn in," and the quiet routine of a passage-making merchantman is resumed. Next morning the May garland, gaily ornamented with ribbons, is hoisted on the maintop-mast, the whole being surmounted by a miniature ship. This remains during the whole passage, considerable pride being displayed by the different ships' crews in this ornament, the making of which is the province of the most lately-married man on board. What can be the origin of all these saturnalia? Is it a sea-going celebration of the Maypole festivities once so common in England, and which, while almost forgotten on land, with that conservatism in everything pertaining to the sea, still sticks among the honest seamen? or is it merely a revival in another hemisphere of the well-known custom of shaving the uninitiated in crossing the equator? Perhaps it is a mixture of both, flavoured with a dash of meaningless nonsense infused into it by the seaman, only

too anxious for any "lark" to break the dull monotony of his life. Curious, however, is it not? this persistency of seafaring customs, for little do these rough sailors know that when they are shaving the little middy who has made his first voyage "over the line" they are only repeating certain heathen rites which their predecessors, the Tyrian mariners, performed to Neptune after passing the pillars of Hercules.

"THE EAST LAND."

Bleak and dreary enough looks the Greenland coast at any time of the year—and distance, contrary to the wont, lends no enchantment to the view. Black cliffs, with a cascade of melting snow falling over them, a white glacier creeping down from the inland ice, a crash as of a berg breaking off from the glacier, an iceberg floating down the coast, are the chief objects which strike the eye and ear. The height of land is not great; and, with the exception of a peak or two like Sukkertoppen—the sugar-loaf hill—the cliffs are all shaved and rounded by the action of ice in former times, when this land lay beneath the sea, or was covered by the huge *mer de glace* which now overspreads the whole interior of Greenland in one vast winding-sheet, as already described (Chap. III.). The first iceberg is always something to be remembered. Most frequently it is quite disappointing. They are generally seen long before the land is in view, and are then only fragments of the more gigantic ones nearer land, but which have before reaching the mouth of Davis' Strait got broken and washed into comparatively small dimensions. Sometimes a black speck may be seen afar off, and then every eye is fixed on it, and the rigging is run to. It is an Eskimo, or "Yak," as the whalers universally call them, out fishing, or perhaps venturing out with that all-prescient scent of his after rum, pea-soup, pocket-handkerchiefs, and other good things usually found on board "Tuluit," or English vessels. If we are on board a steamer we shall have little chance to see him, as he knows that we are not like the sailing vessels, dependent on wind and tide, and may move away at any time. It is not until off the Whalefish or Kronprinds Islands, near the mouth of Disco Bay, that we see much of the natives of the country. Most frequently whalers, if the ice does not look very open ahead, make a call at Godhavn, (p. 104) or, as they call it, Lievely, a little Danish trading-post and residence of the Royal Inspector of North Greenland, situated on an islet off the south-westerly point of Disco Island. It consists of the residence of the inspector, the colonibestyrrer, or governor, one or two workmen's houses, all built of wood pitched, the store-house, and perhaps a couple of dozen rude Eskimo huts. It is one of the smallest of the Danish posts, but acquires an importance as being so directly on the route of the whaler and exploring vessels, and accordingly touched at by them, and as the "seat of government." The trade of Greenland is a strict monopoly of the Danish Government, and accordingly the government puts a check upon any trading or fishing within a certain distance of the coast. It does not, however, prohibit the sale of small articles not used in their trade; and accordingly, in addition to obtaining news of the ice, and such other information, here commences a curious traffic with the natives, known to Scottish whalers, at least, under the name of "trading," or bartering. The articles most in demand by the scamen are models of the native kayaks, sealskin tobacco-pouches, slippers, bags, gloves, caps, trousers, and waistcoats, and various nick-nacks carved

out of walrus or narwhal ivory, which the Greenlanders execute with great neatness and patience, occupying most of the dark winter months, when confined in-doors, in such labour. In payment they prefer bisenits, cotton handkerchiefs, black silk ones, for the women to put round their heads at the place where the hair, being pulled up to form the "top-knot" is getting thin, shirts, or still better—if it is to be had—*rum*, which physiologists tell us is, in

UPERNIVIK, NORTH GREENLAND.

some form or another, a necessity to a people living on an animal diet; for the craving for spirits found universally among all races so situated is only Nature demanding the exemplification of Liebig's law about the mixture of azotised and non-azotised food. The poor people look forward from one year's end to the other to the chance of these stray visits, and will often come far out to sea to have an opportunity of selling their things. Here there is more competition, and accordingly they meet us everywhere, with a from-ear-to-ear grin, dodging us behind the house to offer some pouch or specimen of their workmanship, redolent of an ancient and a fish-like smell. The English sailor, with his proverbial generosity, gives them comparatively high prices for their commodities, and much largesse beside in pea-soup and rum. After they return home, they lie abundantly about their luck on board such and such a like ship, neglect work, and for some time afterwards are dis-

satisfied with the Danish traders' tariff. They likewise learn English with a very improper vocabulary; and, forsooth, in distant Lievely you hear rather a sprinkling of the oath of British commerce. This "whaler English" is a peculiar jargon, though each party concerned looks upon it as the language of the other—as "troakem," a corruption perhaps of the Lowland Scottish "troak" (or trade); "andre man" (other man), doubtless the Danish "andre;" "keesee" (ice—the Eskimo being "seko," though they affirm that the former word is English);

GREENLAND ESKIMO HOUSE.

"meekie" (dog); "keese meekie" (ice-dog, or bear); "shmalley" (small); "nupstaw" (understand); and so with some others, the origin of which admits of no sort of doubt, and are, therefore, unnecessary to be included in this very proper narrative of facts. Many of the words are corrupted attempts of the seamen to pronounce words taken from the language of the Eskimo on the other side of Davis' Strait, which language differs very considerably from the Greenland dialect preserved to us in the dictionaries and grammars of Fabricius, Kleinschmidt, and others, and in the various works translated into that language for the use of the natives. The whaler cannot long afford to accept the hospitality of Lievely, for he must make all speed for the north. Few whales are now caught on the Greenland coast

after April or May, and though Disco Bay and vicinity were at one time the favourite localities of the whalers, it is rarely that even a *Balæna mysticetus* is killed in that region. So little is this looked upon as a contingency that the whalers do not allow it to enter into their calculations as to the success of their voyage.* Sometimes when the ice lies far out to seaward, joining the middle ice of Davis' Strait, the whaler will endeavour to go through the Waigat Strait, between the Island of Disco and the Noursoak Peninsula, and then he calculates (or, at least, used to do in the old times) on finding "fish." Here you will hear quoted a rough old distich commemorative of this:—

"Disco dippin',
Waigat open,
There you'll find
The whales nappin'."

Most frequently, however, at this season (June) he will be stopped off the end of the Noursoak peninsula by the land-ice projecting out for several miles, and he will not fail to be visited, as we were, by the natives in their dog sledges from Noursoak (p. 20) and Niakornak, two Danish outposts, each presided over by a cooper or carpenter, called an "ndligger," or literally, "outliver," the amenities of whose life are none of the liveliest. The ndligger is a gentleman generally possessed of an Eskimo wife, and a numerous brass-complexioned progeny. He is very hospitable withal, and slightly addicted to rum and other ardent beverages—weaknesses which the "governor," as he is jocularly called, has numerous opportunities of indulging while "Herr Engländeren" is ice-bound off his little post.

The whaler has his own names for places along his route, consecrated by long usage and not always in strict accordance with Admiralty charts. His nomenclature is, however, equally to the purpose. Every 'prentice boy knows the dark trap-cliffs of the Disco Island where the snow lies for only a short period as "the black land o' Lievely," and "Bunkè land" lies north of it, and north of this again is "Black Hook," which is only, however, a translation of the Danish Svarte Huk. The little commercial establishment of Prøven is soon passed, and we may drop a boat ashore at Upernivik (p. 108), in latitude $72^{\circ} 48' N.$, for letters for England. At Tasiusak, a little further north, is the last Danish outpost, which has the distinction of being the most northerly abode of civilised man (p. 112). Here lives Jensen, whose name is familiar in more southern latitudes, as Dr. Hayes' dog-driver and interpreter; and at Upernivik used to live Carl Petersen—until his death in 1880 a lighthouse-keeper on the Zealand coast—so well known as the companion of Penney, McClintock, and Kane, and as the reputed author of a narrative of some of these expeditions.† Those who have learned the Greenland dialect of Eskimo, and especially in the form of the corrupted version known as "coloni Grönlandske," can but imperfectly understand the natives of Smith's Sound, and still less the Western Eskimo, whose language Petersen could only roughly translate. I mention this to show that allowances ought to be made for

* For an elaborate review of the capture of whales off Danish Greenland, see Reinhardt and Eschricht's *Ray Society's Memoirs on the Cetacea*, 1867; Rink's "Danish Greenland," edited by R. Brown; and Lindeman's *Arktische Fischeri der Deutschen Seestädte*, 1620—1868 (Gotha, 1869); see also Markham's "Whaling Cruise" (1875).

† *Den Sidste Franklin—Expedition med Foz* (Copenhagen, 1860); and *Erindringer fra Polarlandene optegne af 1850—55. Udgivne af Lieut. L. B. Deichman* (Copenhagen, 1855).

Greenland interpreters, and that future explorers should not unjustly accuse their interpreter of deficiency in the language if he cannot readily translate the dialect of the Western Eskimo, even though their country lies but a few days' sail from his home. We are amid a little group of islands, on one of which (Kingatorsoak) was found in 1824, by an Eskimo named Pedluit, a Runic column showing that long before Ross and Parry were dreamt of, old Norse fishermen—it may have been pirates—on one of these restless, roving expeditions of theirs, during which they discovered America, and settled near where Taunton now stands, visited this high northern latitude. The stone was stolen from the Museum of Northern Antiquities at Copenhagen; and though the inscription on it has been variously translated, the following, by the late Dr. Rafn, himself an Icelandic, may be received as tolerably correct:—"Erling Sigvatson and Bjarne Thordarson, and Endride Oddson erected these memorial-stones and cleared this place on Saturday before Gangdag" (25th April, or according to our calculations, 1st May), "in the year 1135." Little reck the whaler for such musty old memories, or that he is now among the Frue Islands of the Danes—the "Women's Islands" of stout John Davis, of *Sunshine* and *Moonsline* memory, so called because the men all fled in trepidation when they sighted his ships, and left only the women to face the explorers. They are not so bashful nowadays. Just as little do our friends care for the islets of plumbago which dot this archipelago—for it is not worth its freight, and there is better game ahead; so he pushes north with all the speed he may until he reaches the Duck Islands. Then again he is stopped by a barrier of ice, for we are now opposite the entrance of Melville Bay—that most dreaded spot in all the whalers' route—to pass which is literally "running a-muck" with the Arctic ice-fields.

"TAKING THE BAY."

For weeks past we have been hearing enough about "*the bay*," and are somewhat familiar with it in theory at least. "Taking the bay" is a serious consideration, a proceeding not to be gone about in a reckless manner. Accordingly, "the fleet" "hooks on," with their S-shaped ice-anchors to the floe, which begins to stretch tolerably—or rather, intolerably—continuously among the islands until the captains have examined the ice, and talked among themselves about the best method of "making the passage." One after another you may see the ships hook on to the thick ice, and boat after boat drop from their sides with crews of volunteers, only too glad for a little "run ashore," even if it should be knee-deep in snow, to the higher islands, to have a look ahead. We join one, and land at an "ice foot," or the remains of the winter ice which clings to the land long after the main floes are broken up, and floundering over the snow-banks which lie deep in the hollows of the island, we climb to the top. What a dreary look-out! To the northward there seems nought but one continuous white ice-field, here and there lined by a few dark-coloured "leads" of water (p. 52), or varied by hummocks of ice and snow, which the pressure of the currents or winter gales have forced up; while landward rises a dreary coast with high cliffs, glaciers, and snow-banks. One remarkable object meets our eye here. It is a curious peak familiarly known to every one who has ever gone so far north by the name of the "Devil's Thumb" (p. 113). It is generally looked upon as the entrance of Melville Bay, and is, I am informed by those who have landed there, an island

The shore-line of Melville Bay has, however, never been properly, if at all, surveyed, the ships which have passed through it being only too anxious to get to the northward, even had the ice allowed a boat to get in shore. The "Devil's Thumb" I can compare to nothing better than a huge edition of the odontoid process of the axis vertebra, a simile which will be familiar enough to many of my readers. Everywhere the island we stand upon bears mark of the wintry cold of the region we are now in. Rocks are scattered about, rent by the frost, and the disintegrated trap is strewn with rough garnets which you may pick up by handfuls. A little green leaf is

TASHIRAK, THE MOST NORTHERLY ABODE OF CIVILISED MAN. (LAT. 73° 21' N.)

peeping out here and there, even above the snow, and the wet banks are spongy with mosses and lichens. A snow bunting (*Plectrofrances nivalis*) is looking about for a nesting-place, and a flock of eider and king ducks (*Somateria mollissima* and *S. spectabilis*) fly quacking by. Just as we slide shouting down a snow-bank, we hear a rush, and a creamy-white object turns the corner. Instantly our rifle is unslung, but we are too late, for before we can get within range our ursine co-occupant of the island is off across the ice-field at a rate which defies pursuit, even did our valour outstrip our prudence so far. Seals are lying lazily basking here and there at their *atlaks* or breathing-holes in the ice, affording abundant food for the Polar bear, though he does not seem always to be so well fed. On these islands are remains of the whalers' prolonged visits, for in addition to the unfailing sardine-box and broken bottle which all the world over remain the monument of the travelling Briton, we see sadder memorials in the shape of graves of officers and seamen of different ships. On one we find the graves of two Eskimo, who were brought to Scotland by one of the Kirkcaldy whalers, but died

of phthisis—a common disease among those brought to milder climates—on his way home again. All of these graves are mere mounds of stones heaped over boxes containing the bodies, with a piece of board telling, in rudely-cut and not remarkably well-spelled words, the name and designation of the dead man beneath. Some of these boards were gnawed down by the bears to the very stump, showing that occasionally they had been driven to considerable straits by famine. They had even attempted to get at the dead bodies by pulling down the stones. One of these attempts gave us an opportunity of witnessing the remarkable

THE "DEVIL'S THUMB," MELVILLE BAY, NORTH GREENLAND

antiseptic powers of cold in this northern latitude. The half-wrenched-off lid of one of the boxes showed the body quite fresh, as if it had been dead but yesterday, though the date on the board proved that it had lain there for nearly twenty years. In the winter, of course, decay is out of the question, and in the short heat of summer the frost imbibed is sufficient to preserve all animal substances, unless decay commences before the winter again freezes it. However, in the Danish burying-grounds in Greenland the bodies are decayed, as one has an abundant opportunity of witnessing, for the bones are scattered around, apparently unheeded. In some instances these boards seem to have been taken away by the natives, who come up in the summer to gather eider-down among the islands. We see none yet, but a broken paddle is seen to be frozen in the ice-floe, telling of former visits. In a week or two these islets are literally covered with millions of eider ducks, who come north here to breed. It is then almost impossible to step ashore without setting one's foot on a nest with eggs, and the whole islet is circled with swarms of birds. In addition to endless roast ducks, the whaler then luxuriates,

from cabin to galley, in eider-duck eggs *ad nauseam*. The ships bring boat-loads off, and it is amusing to see the men in the heat of the summer sun and the ardour of the pursuit running about in drawers, having drawn off their trousers to convert them into extemporised bags by tying a bit of spun yarn round the bottom of each leg. Many of the ships will collect in a day or two as many as from fifty to two hundred dozen of eggs, preserving them perfectly easily by exposure to the open air. From morning to night, and all night through (for we have now continuous daylight), the report of guns is heard from "ducking parties," "looning parties," or whatever name it may be necessary to apply to boats' crews in search of loons or guillemots (*Alca arca*), rotjes (*Mergulus*), and other Arctic birds which now swarm in the open places among the ice-fields, and make the air merry with their noise. In such amusement day after day passes, until suddenly the smoke of the steamers begins to rise in the clear frosty Arctic air, and there is hurrying and scurrying each one on board his own ship, for the floes are opening. Usually some energetic captain takes the lead, for this is something to talk about all summer through, and during the next winter, as the skippers hang about the wharves. Sitting in the "crow's nest," or cask, at the masthead (p. 105), he directs the steersman. Into the opening made by the parting of the ice-fields (by winds or currents) the leading ship enters, followed by several others, either tempted by the same reason or with a view to the additional safety which numbers afford. If the lead continue open all the way through to the "North water," the ship may go through in a few hours, as in the case of the *Alert* and *Discovery* in 1875, but this rarely happens. Suddenly the floes are seen to be slowly closing again; then with all speed the ice-saws are got out, and "a dock" is cut in the ice—that is, a piece the size of the ship is sawn out of the side of one of the opposing floes, and into this space the ship is placed, so that when the two ice fields come together they may not injure the vessels, as they would if she remained in her old position. Sometimes, however, they are too late—the floes are seen to move together; first is a creaking sound, then a cracking of beams, then the stout vessel goes like a chip box of matches. Nothing can oppose the enormous force of these ice-fields. "If the ice does not go through her it will go over her," was the sage remark of an old ice-master. In the meantime the floes which destroy the ship save the crew, who throw over upon the ice bags of clothes, provisions, and other necessaries, which they have in readiness for such a contingency, and another vessel more fortunate picks them up. Sometimes the vessel is only "nipped," and for the rest of the voyage its effects are seen in the cabin-doors not being able to be shut, and so on. At other times the vessel may be buoyed up by the ice for several days; but, again, she may go down so suddenly that the men have barely time to jump ashore. I know of a case in which the vessel went down so suddenly that the cooper, who happened to be in the hold at the time, went down before he could escape; and of another where a man, after being confined for nearly a whole day, was cut out by the side of the vessel by his comrades. The man's horror of mind during the interval may be imagined! The ice-fields move away again, and down goes the vessel. The bottom of Melville Bay must be perfectly strewn with wrecks. Sometimes the vessel may be able to get through into open water before the floes can close, and here the value of a steamer is apparent. Sailing vessels used to put out their boats and tow the vessel through, or the men tracked her laboriously along the floe sides. The few sailing

vessels now generally make arrangements to get a tow from the steamers under these circumstances. When once they are in the North water the men shout heartfelt shouts of joy. Now the great danger—the almost only danger of an Arctic summer voyage to the head of Baffin's Bay—is over, and their chances of a cargo are augmented. Sometimes, however, they will be unable to make a passage in time for a fishery in Pond's Bay, and even, as in some years, unable altogether to get across by Melville Bay, and must go round the southern end of the great middle field of ice lying down Davis' Strait, and work up the opposite coast in the pursuit of the whale in its migration. The reason Melville Bay is so full of ice is that the floes from the north are jammed in that depression by the north winds, so that, unlike the other portions of Baffin's Bay, it is never entirely free from great fields of ice. As the ice is turned up by the iron-shod prow of the steamer a dark, slimy mass is seen, which wags in long strings through the water, like the fronds of the brown tangle* now and then seen floating. This is known as rotten ice by the whalers, and the writer was fortunate enough to discover it to be great masses of diatomaceæ, and that as described in a former chapter (p. 90). To these diatomaceæ the discolouration of the Greenland Sea alluded to by various mariners, from Hudson and Davis to Scoresby, is due.†

IN THE "NORTH WATER."

The whalers are now opposite Cape York, and if close enough the "crimson cliffs of Beverley," dyed pink with the red snow plant, can be seen; and, perhaps, some of Drs. Kane and Hayes' friends performing wonderful antics on the ice to tempt the whalers ashore, for the Eskimo here have no kayaks, or boats, these being almost unavailable, owing to the short time the sea is free from ice, and to the fact that the land-floe is continuously attached to the coast-line. Soon the opening of Smith's Sound will be in sight, but it is rarely that the whalers can go up there. It is often encumbered with ice, and whales do not seem to travel in that direction, but cross Baffin's Bay to the western shore of that sea.

All this time we have left the whaling fleet, either frozen fast in Melville Bay, or, what is better, sailing in the North water in sight of Smith's Sound. Let us take the more hopeful view of the matter, and suppose that they are *en route* for the "West Land," following up the migration of their gigantic game. They rarely cross north of the Carey Islands, going most frequently southward of that group. Very few whalers have ever landed on them, but I am informed by those who have, that there are numbers of the former habitations of Eskimo there. They now reach the opening of Lancaster Sound, and occasionally sail up that inlet. It has been discovered by Messrs. Philpots and Browne that Cape Horsburgh is in reality the extremity of a large island.‡ In like manner, it will be found that there are many unexplored inlets between Jones and Lancaster Sounds, and between Lancaster, Eclipse, and other Sounds lying south of it. Whales are sometimes killed in this vicinity, but most of the whalers make with all haste south to Pond's Bay, where they remain generally for three or four

* *Laminaria longicollis*, De la Pyl; see my Catalogue in Rink's "Danish Greenland," p. 421.

† "Trans. Botanical Society, Edinburgh," Vol. ix.; "Das Ausland," 1868; and Petermann's "Mittheilungen," 1869.

‡ Now known as "Philpot Island;" see "An Account of the Land in the Vicinity of Cape Horsburgh, lat. 74° 44' 24" N., long. 79° W., and of the Island discovered there," by Ed. P. Philpots, M.B. ("Proceedings of the Royal Geographical Society," Vol. xiii., p. 372.)

weeks. It is a common calculation among them that if they can reach Pond's Bay by the first week in August, they are tolerably sure of a good cargo. This inlet was named in honour of the Astronomer Royal of that name, but it is not a bay, as was originally supposed, but an extensive inlet of the sea, the innermost portion of which is called Eclipse Sound, after the whaler *Eclipse*, which first sailed up it. Its shores are inhabited by numerous Eskimo, most of whom remove in the summer to the outlet of the sound, to be near the whalers. The land ice generally lies at this period for several miles off the shore, so that it is difficult to land. However, we are soon visited by the natives. A darkish speck is seen in the distance, then another, and another, until they approach near enough to show them to be parties of Eskimo with their dog-sledges. Afar off they hail us with cries of "Timoo! Timoo,"* which ring clear through the Arctic air, and as they approach nearer, "Pilletey! Pilletey!"—"Give us something! give us something!" They are a wild-looking set of fellows, very different in appearance from the mild Lutherans on the other side of the strait, but, withal, they cannot be denied to be a manly-looking race of pagans, vastly superior to their civilised Greenland brethren in every physical characteristic. Their object is to trade narwhal "horns," walrus teeth, skins, ornaments, whalebone, and, indeed, everything for anything they can get. Muskets are, however, chiefly in demand, and most of them having obtained these, they are very anxious for gun-powder and percussion-caps. At one time they would accept almost any kind of gun, but they are now remarkably good judges both of the workmanship and shooting powers of the weapon. Anything they will sell, and I have seen natives strip themselves almost stark naked when offered a price for their clothing, nor will they even hesitate to offer to trade off their chubby-looking babies, if they think any one is willing to purchase them. They, however, always show a preference for useful articles over mere toys, though a story is told of one who was so captivated by the charms of a fiddle in the possession of one of the seamen, that he offered whalebone for it, until finally the owner received enough for his instrument to bring £100 in Dundee. They are very fickle, however; for before the ships left the fiddle was bought back again, in exchange for a pair of scissors! Barter with these natives is a perfect passion, and during the whole time the whalers remain at Pond's Bay their time is passed in one continuous round of excitement, dashing backward and forward between the shore and vessel, often sleeping all night coiled up on deck or below, and sometimes on their sledges out on the ice, or inside their upturned skin kayaks. Their women and children are brought along with them, the object being to pick up "unconsidered trifles," for nothing is safe from these hyperborean savages, though their brethren in Greenland are now so moralised by the missionaries as to be perfect strangers to dishonesty. Some of the women are occasionally not very well behaved, and during our stay a melancholy tragedy occurred. One of the chief men, suspecting his wife of infidelity, took her out on the ice and plunged his large knife into her heart, killing her on the spot. Generally, however, all goes well, and our wild friends enjoy to the utmost their annual holiday, to which they look forward through all the long winter and short summer. If you meet them when walking along the ice-floes, they will immediately make room for you on their sledges, though it is not practicable to stop the dogs in their wild career. Accordingly, you watch your chance, and tumble down upon the motley occupants of the open sledge amid shouts of laughter. The natives sit on their sledges back to back, like the people on an Irish car-

* A mere salutation, equivalent, perhaps, to "Good cheer!"

There is no covering of any sort in the summer, but behind are an upright pair of reindeer horns, on which hang extra lines, whips, traces, hunting utensils, &c. Every article is of a ruder make than those of the Greenlanders. Wood is scarce, and a piece of iron hoop has its price among these denizens of the snow. Their kayaks and umiaks (open flat-skin boats) are built on exactly the same plan as the Greenlanders', but larger, and of a ruder construction. Most of the women are slightly tattooed, but all are taller and healthier-looking than the Green-

STRANDED SPERMACETI WHALE. (*Catodon macrocephalus*.*)

landers. Going ashore, you are received kindly by them, but they are not always to be trusted. One of our crew, having wandered off from his companions, was enticed into a hut by some of them, and there stripped to his shirt (and that he with difficulty saved), in which woful plight he returned to the vessel. Their habits are those of the rudest pagans, though in a slight sketch such as this, in which they are only incidentally met with, it is impossible to say more.

* The Spermaceti whale is chiefly a denizen of the warmer regions of the Pacific. It is, however, not uncommon off the north-west coast of America, and even ascends within the Arctic regions north of Behring's Strait. Though Fabricius mentions it as frequenting the southern portion of Davis' Strait, and as known to the Eskimo under the name of *Kegutilik* or *Kigutelirkoak*, it is certainly a very rare Cetacean in the North Atlantic, and is at present only known to the Greenlanders from tradition. I have never heard of more than one being killed in Baffin's Bay in modern times.

Dr. Kane's account of the Smith's Sound Eskimo, with some variations, gives a fair account of these rude children of the snow and ice-fields. When the whalers move away the Pond's Bay natives settle down again to the ordinary routine of their hard struggle for existence, but it is said that the dissipation they indulge in during the few weeks the whalers are in their vicinity operates badly upon them, though it ought to be noted that they do not care for spirits, and that rum is seldom offered them. Indeed, some of the modern whalers are "teetotal ships."

They are very migratory, and move up and down the coast at different times of the year. Like the nation generally, they are rapidly decreasing, their number being now much smaller than in former times. They collect in one or two little communities, principally for the convenience of meeting with the whale ships, and mostly in Pond's Bay and Cumberland Sound. Some years ago a whaler landed at a locality where in former years natives used to come off to the ship, and was horrified to find the first hut full of dead bodies, black and stiff. The second visited was the same, and so on with the half-dozen of which the settlement consisted. Small-pox does not appear to have troubled the western natives much, though in earlier times several thousands of the Greenlanders died in a few years of this fell disease, and many thousands more with what the old writers call the "black death," a plague which in the Middle Ages desolated Europe.

ON THE "WEST SIDE."

September is now approaching, one of the pleasantest of autumn months in more favoured regions, but in these dreary latitudes it is the season in which the nights are beginning to be cold and dark, and sleet, snow, howling blasts and crashing icebergs, warn the navigator that the winter with its icy terrors is approaching, and that all who know what is good for them ought to be preparing to leave for another country. Hitherto the days have been sunshiny and warm—almost too warm—though out at sea the gentle breeze blowing over the ice-fields keeps it always cool. However, a ramble on land is not so pleasant. Without shelter of any sort, the sun's rays, reflected from the glittering snow-banks and bare lichen-covered rocks, are overpoweringly warm, and the perspiring traveller, floundering it may be through snow-wreaths, soon sits down exhausted, most likely tempted to quench his thirst by eating snow, a practice which, as every mountain tourist knows, only aggravates his craving for water. Out on the ice-floe, which is our usual place of promenade, the heat is still more oppressive, even if one "constitutional" be not disturbed by somewhat unpleasant companions. It is about this period that the ice-floes are breaking up. Of this the writer retains a rather disagreeable recollection. Walking one morning, fowling-piece in hand, along the edge of the floe, I noticed a crack in the ice which could be easily stepped over. Having forgotten my snow goggles, on returning, half-blinded with the glare of the snow, I was suddenly brought to a standstill by plunging into the now broadening crack between the separating fields. Luckily I came up at the edge, and while endeavouring to scramble out, was in no way reassured by observing a Polar bear—thwarted in its endeavours to procure a seal for breakfast—watching me attentively from an ice hummock close at hand. There was just a possibility that the bear might have mistaken me for a seal, and as my lethal weapon was now so damped by the souse it had undergone,

my situation was not the pleasantest. Luckily it was observed from the ship, and a few rifle-bullets, landing in disagreeable proximity to the bear's head, soon frightened it away. Night is the pleasantest time to go a-field. That is, we call it night by courtesy; but for three or four months it is just as light at midnight as at midday. However, the sun gradually sinks lower and lower, until it appears merely as a great shining ball on the edge of the horizon, and then slowly disappears below it. It is at first rather confusing, this mixing up of the old conventional night and day, and sometimes ridiculous mistakes occur. Yet there is always something about night in the Arctic regions which indescribably stamps it as night. There is out at sea the same unwonted calmness and stillness in the air, and in all the surroundings, which I have noted as characteristic of a Greenland settlement at the "midnight time." The sun gleams with a subdued glare over the golden-tinted snow-fields and ice-floes, and the bergs float along, with the mild light reflecting from their glistening sides, like silver castles in that quiet summer sunlight. The snowy ivory-gull* flits now and then about the hummocks, or sits dreamily floating along on the broken pieces of ice. The noisy swarms of mollemokes†—the spirits of old Greenland skippers the sailors affirm—gorged with blubber, have now returned to the ice-floes; and the only noise heard is the angry cackle of an obese *Procellaria*, crowded out of its sleeping-place by its fellow. The rotjes, loons, and dovebies, which all day long blacken every pool in the ice-floe, are now sitting in long pensive lines on the edge of some floating piece of ice. A seal, resting to stare round just at our stern, or a small family party of walrus floating along on the ice, are the only living things about. A temporary excitement may be raised at the sight of a huge bear which has approached, having scented out the smell of supper from afar off; or the stillness of the midnight air in Hyperborea is broken by the shouts of the crew, who tumble up half-dressed from below, the twirling of pulleys, and the "flop" of ropes as the boats are hastily lowered, for a whale has just blown in *dolce far niente* case not a hundred yards from the ship.

AUTUMN AND HOME.

All is over now. The twilight has given way to the alternate night and day. The nights are cold, and in the morning a "raw fog," which goes to your very bones, meets you as you come on deck. Storms of wind are not uncommon, and the noise of the bergs crashing together, though beautiful to people abounding in more sentiment than is usually harboured aboard a whaler, is rather disquieting to the captain's mind. He accordingly moves "suth'ard," in advance of the weather, and in pursuit of the whale, which now begins travelling along the westward shores to its winter quarters somewhere out of the limits of fixed ice, but where, is not known. Short halts are made at Home Bay, Clyde River, and other localities, the names of which hardly express the real geographical nature of the places. Most of them are inlets of the sea of great but unknown extent, never penetrated by man; and, unless the Admiralty choose to spare one of their idle ships, and a few of the many officers wearing out their lives ashore on the cheerless joys of half-pay and prospects, most likely never will be. By the beginning of

* *Pagophila eburnea*.

† *Procellaria glacialis*.

October they are opposite what is marked on the chart as Cape Hooper. South of this lies an extensive sound, not indicated on the usual charts, known to the whalers as "Yakiefjord," or literally, Eskimo-fjord, from the number of natives who were found there when it was discovered, though few, if any, are there now. If the whaler has not a cargo yet, he either goes south to Cumberland Sound (Kenisoak), or to a little harbour known as "Hangerman's Cove" (from the circumstance of a native being found suspended by a line over a cliff when it was first entered), or the majority retreat into this "Yakiefjord"—or rather into a little *cul de sac* just off it. Here the ships lie secure while the autumn storm rages outside; and every morning the boats go out waiting for the sight of whales. This is called "rock-nosing." It is not very successful, but still there is a chance of their obtaining "a fish." If one be captured the vessel comes out and assists in towing it into the harbour, there to be "made off," or stripped of its blubber and whalebone. While in Yakiefjord, the idlers on board, such as the engineer, captain, surgeon, &c., amuse themselves reindeer-hunting, and occasionally have a pot-shot at a wolf, numbers of which abound in this locality. It was for this reason that the Eskimo abandoned the locality—they could not keep their dogs from the wolves. According to his industry, or the state of his cargo, the whaler will now move home. It is not often that he stays later than the 20th of October, though it sometimes happens that those who go into Cumberland Sound will even prolong their stay until the beginning of November. This later locality is the *Meta incognita* of Sir Martin Frobisher. Of late years it has become a favourite haunt of the whaler, many of the ships, particularly the American, wintering there to capture whales in early spring. They are assisted in this by the natives, who are now amazingly Americanised, speaking broken English after the transatlantic fashion, and accomplished in many vices not altogether peculiar to our American cousins, but which, nevertheless, they have the responsibility of having introduced into this locality.

Though British territory, by right of discovery and proximity to Hudson's Bay and the Dominion of Canada, I should not be surprised were the Americans (in case the locality becomes valuable) to claim it by right of occupation, and on account of their nation having produced a citizen who first surveyed it in a rough way. Formerly all the localities hereabout had some flavour of that quaint piety of the old navigators who thought, that when they went so far afield, they were taking their lives in their hands. The "Cape of God's Mercy" is on our lee, named in all sanctity by John Davis, of Bristol; but immediately to the south of this is (let us say) Cape Silas Y. Dollup of Dollupville, Arkansas, who presented a jack-knife and a keg of dried apples to the "expedition" of his enthusiastic countrymen, to whom we owe the somewhat peculiar nomenclature which has now overlaid the ancient one affixed to the *Meta incognita* by the gallant captains of Queen Bess's reign. By the first week of October there are few of the whalers which have not left for home. For the next few weeks stormy weather may be expected. Gales are sure to be experienced off Cape Farewell, and across the Atlantic a calm is a rarity indeed in the month of October. It is seldom that more than a fortnight is occupied at this season in running between land and land. The old whalers were rough navigators. Some of them knew no more of scientific navigation than was comprised in taking "a latitude" by the quadrant. Having obtained latitude got in a rough way, they "put her into it," and "ran down the coast." Sometimes

VIEW IN KING WILLIAM'S LAND, EAST GREENLAND.

the land-fall, thanks to good seamanship and better luck, was tolerably fair. At other times it was not so good, and probably the west of Ireland would be the first land-fall. However, so long as they did not miss the British Isles the whaler of the *ancien régime* was content. He was a rough, but a courageous, hardy sea-dog. In war-time he frequently took out letters of marque as a privateer, and, generally speaking, not only defended himself, but is even rumoured to have, in some cases, made up for a bad voyage by a profitable raid on "Bonny's" merchantmen. Traditions are indeed still extant of the stout fights the last-century whalers made for liberty and cargo with the French cruisers who hovered around them. One is said to have fired off all his ammunition until he took to loading with cheese, and, finally, as a last resource, fired, with his last pound of powder, the poker and tongs. The "Parthian shot" was successful. The Frenchman sheered off, under the belief that his once-despised enemy was only beginning to fire chain-shot. Still many were captured; but fourteen or fifteen years ago, when the writer of these lines was more intimately acquainted with the *personnel* of the whaling fleet than he has been since, he was acquainted with old men who, as very young ones had lain in the French prisons, captives in the first Napoleon's wars. Another terror, almost as much dreaded, was the press-gang. Knowing when the whalers were likely to return, cruisers lay off Shetland and the Pentland Frith, ready to fill up their complement of men with the excellent seamen whom they could always find in abundance on board the whaling-vessels. To avoid this pestilent necessity of war-times, the men were in the habit of taking the boats as soon as they arrived on the Scottish coast, and then cautiously working their way to port along the coast, keeping in shore, avoiding towns, and setting a sharp look-out seaward. The apprentices and officers, who were not pressible, then took the ship home. The whaling captains of modern times, though rather inclined to be rough in their manners, and, from much association with each other, and little with the rest of the world, to err on the side of "over-bumpiousness," are yet skilful seamen, well acquainted with the mystery of modern navigation and the best nautical instruments. They make a sure land-fall, and by the middle or end of October are signalling for a pilot for the Pentland Frith, if necessary; and as they generally reserve coal enough to be able to steam down the coast, are usually in Dundee within a few days of sighting Cape Wrath. It is pleasant to see again the familiar merchantmen, the sleepy towns, the bays, the trees, the cows, the horses, and other signs of a world fitted for civilised man. By long habit and tradition certain courtesies are expected to be paid to a whaler by the old-fashioned coasters. One of them is to "broom" a whaler. A passing vessel will send a man into the rigging to wave a broom. This is equivalent to asking "What's the cargo?" The whaler's boatswain replies by a downward sweep of the broom for every whale on board, and at the conclusion he is always treated to a friendly cheer from the coaster. It is needless to say that, apart from the "crow's nest," which has probably not yet been removed from the rigging, all seafaring men know a whaler by her build and general rig. For days past the vessel has been thoroughly cleansed, and by the time she drops into harbour, and the wives come on board to welcome their errant husbands, everything is "ship-shape Bristol fashion." The oil is discharged in a few weeks, the men paid off, and for some time the vessel lies "laid up in ordinary," with nobody but the ship's keeper on board. By February, however, she must be again fitted out, and in March the good ship takes her departure to the

frozen North. The seamen in the whaling trade rarely know of any other branch of seafaring life. Many of them have never seen corn grow since they were boys, and all of them are greatly wedded to their life. They think there is no life like a whaler's life. They appreciate their stirring adventures, and are inspirited by the gambling element which enters into it. Poetry they have little of, yet in talking with these rough, honest men one is frequently led to believe that they can appreciate the spirit of the lines in their honour if they fail to understand their metre:—

“ Calm through the heavenly sea on high
Comes out each white and quiet star :
So calm up ocean floating sky,
Como one by one upon
White quiet sails from the grim icy coasts
That hear the battles of the whaling hosts ;
Where homeward crews with feet and flute in tune,
And spirits roughly blythe make music to the moon.”

CHAPTER VI.

MAN IN THE FAR NORTH.

WE might linger long in the Arctic regions, fascinating as are these seemingly inhospitable lands ; we might speak of Iceland, its sagas and its songs, its warriors and its scalds, even though little of that island lies within the Arctic Circle. We might describe Novaia Zemlia, and recall William Barentz and his adventures, and the romantic story of the discovery of his wintering-house and relics a few years ago ; or we might sketch Greenland more fully, and run in imagination round the circumpolar lands discovered by Ross, Franklin, Parry, and others. Of these, however, the map will give the outlines, and their general features and character we have already described in sufficient detail in the preceding chapter. Our space is limited, while the Arctic regions are almost unlimited ; for we do not yet know their extent. We must, therefore, devote this chapter to man and society as they exist in the lands chilled by the “north wind's breath.”

DANISH LIFE IN GREENLAND.

The popular idea of a residence in Greenland may be summed up in a very few words—cold, train-oil, and blubber, with general misery thrown in to fill the interstices of the dismal picture. In reality it is no such thing. The European resident may drink train-oil if he can afford it, and eat blubber if he prefers this article of diet, and his digestion can bear it. As for misery, he can get that anywhere without going to Greenland for it. From Cape Farewell up to a little north of Upernivik, in $72^{\circ} 48'$ (p. 108) north latitude, the west coast of Greenland is dotted with little Danish trading posts.

The east coast, and all outside of these limits, are left to Polar bears and the handful of Eskimo who dispute possession of the ice-bound coast. As for the interior, it is no man's land. These little Danish outposts of civilisation are very primitive settlements. We have figured some of them on pp. 20, 41, 101, 108, 112. A few dogs, generally never more than four or five, with their families, and a little collection of Eskimo, constitute the *personnel*

ARCTIC SNOW-STORM.

of the settlements. The trade of Greenland is a strict monopoly of the Crown, whose officials are placed there to superintend it. The Government conducts the commerce solely on principles of philanthropy, the interest of the natives being the chief object in view. The result is that the Eskimo are, within the Danish limits at least, prosperous, educated, and Christianised little fur-clad folk, and if they be sometimes in want that is due to no fault of the Danish Government, but mainly to their own improvidence, or to the many slips "between the cup and the lip" which fall to the lot of the hunters of seals and whales, and the fowler of eider ducks and geese. It would be difficult, within moderate limits, to impress upon a reader who has been taught to associate Greenland

and whale oil, Iceland and ice, the wholesome fact that neither idea is exactly correct. Ice there is enough in Greenland, but there is also a pleasant life, such as the kindly Danes, who have made that country their home, chose to make. Perhaps I can best transfer to the reader my own impressions if I sketch here a Danish settlement as it first came under my notice some years ago. The settlement is in about 69° N.

QUEEN AUGUSTA'S VALLEY, KING WILLIAM'S LAND, EAST GREENLAND.

latitude, and the sketch may do service for almost any of them. First, however, it must be premised that the Danes have had modern settlements in Greenland since 1721, the Icelanders, who discovered it in the tenth century, having previously lived in the southern fjords until about the year 1500. Let us, then, suppose ourselves landed from the good ship which has borne us from Copenhagen. The Danish ships are lumbering, bluff-bowed old vessels, never in a hurry, and rarely making more than one voyage during the summer months, which is, of course, the only season when Davis' Strait and Baffin's Bay are open to navigation. Their arrival, it is needless to say, is the great event of the year. They form the sole connecting-link between Europe and Greenland.

between the Greenland Dane's land of adoption and what he yet fondly talks of as "home." Let us suppose, therefore, that the Eskimo pilot has guided us through among the icebergs into one of the little harbours of his country. The rusty battery on the cliff has been fired, the white cross of Daneborg has been run up, the scarlet and yellow-hooded ladies, in their skin jackets and b——s, on the cliffs have raised a treble cheer, which the bass lungs of the boys and men have caught up, the anchor rattles through the hawse-holes, the "Governor" and the priest have boarded us, and in a few moments we land in the flat-bottomed skin boat, or umiak. We jump ashore on the ice-shaven rocks, and are in John Davis's "Land of Desolation." It is June, but the snow is not yet off the ground. There is a snowy-looking sky overhead, though the air is clear, and the calving of the icebergs far off can be heard with a distinctness unknown in southern latitudes through the clear, rarefied air. We arrive just as the birds of passage arrive, and all nature has got thawed out of the winter bonds of frost and snow. We live in the "kirk loft," the attic above the church, and a queer little wooden structure, black pitch on the outside, it is. It is built of drift logs, and beyond the fact that it serves for the legitimate purposes of a church now and then, its walls are chiefly utilised by the Eskimo as the place for hanging their muskets, spears, and harpoons. These lethal weapons festoon it like votive offerings in a hyperborean temple of Neptune.

We have been engaged all the morning in getting in our household gods, and now we are sitting talking of our future life in this distant portion of the world, as we look out of the window, taking a bird's-eye view of the settlement. The snow-storm which, soon after our arrival, welcomed us, has now abated for a while, and the sun being now high in the sky the bare ice-polished rocks appear black, above the surrounding whiteness. Here, tumbling over a cliff, is a mimic cascade, formed by the melting of last winter's snow, or a hollow where the water has accumulated until it forms a little lake, bordered by a thicket of sedge and other Arctic plants, now beginning to sprout above the snow. Not a tree nor a shrub is to be seen. We are in North Greenland, and these sylvan luxuries are not to be found here. Our apologetic guide, jealous of the honour of his country, however, assures us that in South Greenland there are birches high enough to conceal the reindeer, and asserts even that one sixteen feet high has been seen in some of the sheltered fjords of Frederikshaab district.

In this part of the northern world, however, we are content to gaze with wonder on an inch-and-a-half stem, which is exhibited in front of the Governor's house, as the limit to which an Arctic forest tree in the "seventies" can attain. All else is snow and bare rounded rock, alternated with many swampy valleys; and far beyond is the inland ice, which seaward shows itself in fleets of icebergs, and to the ear is patent by the dull, sullen sound which every now and again strikes the ear, as one is detached from the glacier, or is dashed against its neighbour, when the displaced water rolls in like breakers on the tideless beach. A few Eskimo huts—humble turf mansions—are scattered over the rocks, and the inmates are boiling coffee over a fire made of Arctic dwarf birch, in front of the trap-like door. In winter they burn oil as fuel in their soap-stone lamp, but just now they are economical. Coffee is, however, the Greenlander's great luxury. A stimulant he yearns for; and as spirits are denied to him by a paternal government, he supplies

the want with black coffee, burnt on a rock, and roughly bruised with stones as the beans are enclosed in an old leather mitten. A woman, who has been trying to clean some eider-down on the rocks, has been lately driven within doors by the snow, and is now hurrying down to the shore to dress a seal, which her husband—a chubby Eskimo—has just landed out of his kayak. He is now—his share of the labour over—putting his little skin and lath canoe on the frame, where repose the rest of the canoes belonging to the “coloni.” All of the smaller fry—the hoods of their skin jackets over their ears—are running down to see if Johannes’ seal is fat, and in good condition, and the dogs are scenting the plunder from afar. Already a fierce-looking wolfish brute has seized hold of a fathom or two of intestines and is off (pursued by half a dozen little boys and girls), howling, as ever and anon the well-aimed crack of the long whip tells that the *bit has come out*. Over on a little island, just off the shore, other women, more careful, have removed to dress their seals. Here they get rid of the dog nuisance, and the rocks are spotted brown with seals’ flesh drying for winter’s use. On frames are suspended long festoons of the intestines plaited like the “gimp” on ladies’ dresses. Bones and refuse lie everywhere about, giving forth that odour—an arrant and a sealy smell—characteristic of a Greenland settlement. The men are “loafing” about, sitting on the flat roofs of the huts, or leaning against the turf embankment of the church end, which seems to answer the place of the street corner in more southern climes. Lines of boots made of dressed seal-skin, with their dogskin socks, are hung out to dry, and women are busily engaged rubbing them with a piece of wood. This is called the *kamek* or boot-stick, and well-to-do folks always require at least half-a-dozen pairs of boots, because they must be frequently changed if wet by perspiration, or otherwise, and rubbed soft with the “*kamek-stick*.” This *kamek-stick* is often familiarly called the “*reiser kone*,” or travelling wife—it being the wife’s special province to rub the boots until they are in a condition to be worn again.

In Greenland, if you don’t wish to be “cut,” you must make the first calls at the houses of the residents. Indeed, the custom is a Danish one, and, moreover, a rather awkward one, but still it is absolutely necessary to obey it, if you wish to keep from offence. We have already peeped in at the Governor’s or Colonibestyrrer’s—literally the “best man in the colony”—to deliver our official letters, and as we are invited to his house later in the evening, we shall drop over to the Lutheran priest’s. We reach his sitting-room under the pilotage of a strange-looking Eskimo servant girl, with a high topknot and gaudy boots of dyed leather, through the kitchen, for Greenland houses are built more with a view to warmth than elegance. Most of the Greenland officials speak English, and as “Herr Pastor” is a “Kandidat” of Copenhagen University, he is no exception to the rule. We accordingly sip the inevitable coffee, and hear the ways of our Arctic parson’s life. He has been upwards of forty years in the country, and expects to die there. Ten years is, however, the rule. On the expiring of that period of expatriation the zeal of the young missionary has usually evaporated to that extent that he accepts with avidity the smallest parish in Jutland or Zealand. In reality, however, there is little of the missionary in his calling, his duties partaking more of those of a parish priest than anything else. They have only “Danish church” every third Sunday—that being about as much as the European residents are supposed capable of standing of Herr Pastor’s ministrations, though the natives are

favoured with a little discourse every Sunday. As our residence is in and over the church we are fully sensible of the fact. The men sit at one side, and the women at the other, after the fashion among the Danish peasants. An Eskimo plays the organ, the voices of the congregation joining rather sweetly in singing the Eskimo version of Luther's hymns. If the day be warm we are deeply conscious of the fact that divine service is proceeding in 70° N. latitude, for through the keyhole and the cracks in the door there proceeds an odour of stale seals—a fact not at all surprising, considering that the whole

BLUE ARCTIC FOX. (*Lepus lagopus*.)

audience is engaged, more or less, in the capture and preparation of the flesh and skins of these animals, and that all of them are dressed in their hides. Even under the Lutheran gown of the priest there peep hairy trousers and Eskimo boots, and the dogskin collar of his skin jacket appears mingled in the most familiar manner with his ruff—or “millstone,” as the Danish boys irreverently style that distinguishing clerical ornament of the Scandinavian cleric.

The Arctic vicar's parish is one hundred and forty miles long, though sparsely peopled enough. He visits it only in the winter. While other parsons keep their cobs, our northern friend has his dogs, his sledge, and his ancient dog-driver. With these he skims over the frozen sea in winter, though the support of his ravenous team in these times when seals are scarce, is a source of great anxiety to the reverend gentleman's mind. In

SAMOYEDE TRAVELLING ON SNOW-SHOES (REINDEER AND SLEDGE IN BACKGROUND).

Greenland, as among the Danish peasants, no matter what time you call, coffee is offered to you, and while we drink we examine his books. The *Illustrated London News* is, we find, "taken in" here, in addition to its Danish imitation. The Tauchnitz editions of Thackeray, Dickens, and Trollope are invariable occupants of a Greenland officer's library shelves, in addition to Danish theological writers of less note but more unctious; we also find some volumes not less familiar, and recognise in them that superlative reputation which consists in an author's work reaching the window-sill of a Greenland

VIEW OF OMENAK, NORTH GREENLAND. (From an Original Sketch.)

priest. The parson lives far from "home," one would think, but yet the father of his colleague paid him a visit only a few years ago, and, on the whole, our host is not inclined to look upon his lot with the same degree of commiseration as we are apt to do. We leave the prosy old gentleman in a dogskin, and look in upon the doctor—a more cheerful sort of gentleman—if we could only strike upon a language which we mutually understood. However, we cheerily "break bread," the bread, however, bearing about the same proportion to the liquid consumed as the halfpenny worth of bread did to the "intolerable deal" of sack in Falstaff's bill of fare. The doctor has passed sixteen or seventeen years in Greenland as one of the two district surgeons, and is as happy as need be. He is an enthusiastic naturalist, and in the Royal Museum at Copenhagen ranks as somebody. He has just returned from a long tour of inspection

in his boat—which is his brougham—and is now busy compounding a cathartic for a greasy-looking Eskimo who has over-eaten himself at the last debauch of seal's flesh and coffee. We have now got pretty well over the upper crust of the "coloni"—the Danish residents, though more numerous here than in the neighbouring settlements, being less than a dozen—and so we go back again to the church to dress, in order to meet the "society" of the place. "Dressing" in Greenland consists in washing our hands and faces, and re-tying our neckerchiefs. The short spell of sunshine has brought out clouds of mosquitoes, which annoy us dreadfully. Indeed, the natives are not exempt; and later in the year we see some of them covering their faces with the most doleful of black muslin "mosquito bars." Flowers are beginning to peer out in the sunny chinks of the rocks—saxifrages, waxy pyrolas, the Polar rhododendron, and the blackberry. We ramble over the rocks, in after-days familiar enough to us, with crowds of natives staring open-mouthed at us, and a troop of snarling dogs yelping at our heels, until we come to the "Governor's," or Colonibestyrrer's, house, a wooden building of one storey, such as is figured on p. 112, with doors and window-sashes, and pleasant muslin curtains at the windows. It is company day at Herr Colonibestyrrer's—the regular state Sunday-night's party after *the* ship arrives. A knot of Eskimo are here also, watching the arrival of the company, and gaping with awe and wonder at the last Copenhagen bit of finery on the Arctic dandy, who even here finds his unweleome way. After a circuitous route through the kitchen, we are ushered into *the* room of the gubernatorial mansion, the type of all such apartments in the Greenland "colonies." The furniture consists of a sofa, which has done duty for a long line of Governors; a still older bureau, a long stove surmounted by a statuette of the Great Napoleon, a portrait of Byron, another of good King Frederick the Seventh of Denmark, with some photographs, and the usual etceteras of a room. The floor is white scoured, and the windows full of Indian cresses, geraniums, roses, and fuchsias. There is a piano—the last thing we should expect to meet with in Greenland. There is also a sleepy cat, and, above all, an antique eight-day clock in the passage, which strikes six as we enter, and is, to my mind at least, the most Christian-looking piece of furniture we have yet seen in the country. Strangers are rarities in Greenland, and our arrival all the way from England is quite a sensation to this quiet outpost of civilisation. Accordingly we find a little party waiting to receive us. Through clouds of tobacco-smoke we return their greetings, as room is made for us on the sofa. It is not a fashionable party, but we all enjoy ourselves nevertheless. All the men wear sealskin trousers, and most of them sealskin "aneraks," or blouses, covered with checked cotton. All the men, women, and children wear the inevitable sealskin boots, beside which our clumsy English boots look so odd that we are fain to push them out of sight. Everybody is there: the captain of *the* ship and his mates, the wife of the Colonibestyrrer from over the fjord, Herr Pastor, and Fru Pastorinde, whom the lady from "over the fjord" kisses in quite a home-like fashion: it is so hypocritically British. Then there is a broad-backed gentleman, who is the "assistant" trader; the doctor, and his wife and children, besides the Governor's family, including a young lady in pink muslin, an unwonted garment, which, like the piano, is an agreeable surprise to eyes long unfamiliar with it.

There is much talk, and, it is feared, not a little scandalous gossip, for tittle-tattle and evil speaking are bits of civilisation not frozen out of Greenland. We have a little music, and the lady in pink muslin grinds out, for our special benefit, the "Ratcatcher's Daughter" on an accordion, just brought out from Denmark, being apparently under the belief that the ditty in question is the British National Anthem. This young lady, and her brothers and sisters, have all been born in Greenland, as were also their father and mother, and none of them have as yet been out of the country. Except in that indescribable "something" peculiar to people who live long in isolated parts of the world, neither would seem to have suffered much from their voluntary expatriation.

The room in which we are seated is pleasantly decorated with bouquets of Greenland wild flowers, and the windows are bright and fragrant with the plants of a softer clime. All the men smoke long pipes, to which they help themselves from a rack on the wall; and the ladies gossip, until an Eskimo girl, in a topknot and seal-skin jacket and trousers, announces dinner—"supper" they call it—in another room. The Governor then says "Ve's'ko"—"If you please"—and, after the customary fashion, we pass through the kitchen to reach the dining-room. The meal consists of Greenland and Danish fare: rye and wheat bread—of which everybody takes two pieces at a time—reindeer, mattak (whale's skin boiled to a jelly, and very good); smoked salmon, sliced very thin, and eaten raw; raw ham, stoupes of *Kaleralik*, another Greenland dish, composed of a fish allied to the halibut,* smoked, but very oily and tasteless; ptarmigan, hermetically sealed in tins since last winter; "schnapps," or Danish corn-brandy; Greenland and Bavarian beer ("baierske" they lovingly call it); claret, or "rodvin," besides Danish butter and cheese. After these solids and liquids succeeds a cup of a very weak liquid, which is expressively enough called *The-vand*, literally "tea water." Tea is, however, very little drunk, coffee supplying its place. The ladies of the house, after the Danish fashion, wait on the guests, scarcely sitting down at the table. At first there is a little awkwardness, but it is a custom among the very best class of people, the children sometimes acting in the same capacity, and is considered not to derogate from their dignity in the slightest degree. It is only a piece of high-bred Scandinavian courtesy. The meal finished, the host says, "Velbekome!" and we all shake hands, and say, "Velbekome!"—"May it agree with you!"—and adjourn to the next room, where a veteran, in very wide sealskin trousers, confidentially imparts to me the information that in the good old times the fashion was to kiss when the guests separated, but that it had long been discontinued on account of strict impartiality in the osculation not being observed. Then many more pipes, and more "tabak," and very much more rum and water. There is also introduced on the table an abundance of Danish punch, a liquid compounded of a bottle of claret, one of rum, one of water, with sugar to suit, and a slight amount of "Swedish banco," a fiery beverage, tasting like sweetened East Indian arrack. Just as we are beginning to lose sight of each other in the smoke, a sailor makes his appearance to report to the captain that two icebergs are sailing into the little harbour, down below the window, and are likely to injure the cable. The alarm proving groundless, the man—no ways loath—is pressed to

* This fish is *Hippoglossus pinguis* of naturalists, and is in reality a small species of halibut.

stay, for, like the mariner in Dibdin's song, he bears the reputation of "playing the fiddle like an angel," and the room being cleared, those who have not got over their dancing days waltz and dance reels until the old log-house shakes. The snow still continues, but it does not interfere with the general hilarity, for the seamen are in the midst of a ball which they have given to the native *belles* in the empty storehouse just outside. The sound of their merriment reaching us here, we have the curiosity to see the fun.

Dripping with snow, we peep in at the door of the ball-room, a low-roofed apartment, damp and dirty. It is crammed to overflowing, and the floor is crowded with spectators, principally the uglier of the girls, and the males who are considered sufficiently of the *haut ton* to mingle in the dance with the "Kablunaks."* The native Palimurus sits in the window and serapes the fiddle most lustily while the Scandinavian mariners twirl their swarthy partners—hot, perspiring, and odorous of seal-oil—through the "maze" of dances, Danish and Greenlandic. One of these dances, called *Akhampengerseout*, the "dance of eight," seemed to our uncritical eyes to consist chiefly of dancing round in a circle, hand in hand, and then breaking off into a kind of reel, and now and then twisting your partner round. The girls danced wonderfully well, and seemed certainly to enjoy themselves amazingly. After the dance each of them adjourned to a little ante-room, where there was a modicum of mild watered selnapps, under the custody of a trusty boatswain, who dispensed it in thimblefuls to the fair (*sic*) ladies, amid remonstrative cries of "Ah! ameloo!" ("More!"). We watched them for a little time and then left, amid indignant murmurs, each "wallflower" expecting to have had the honour of dancing with the *Tuluit*,† and of sharing in the grog which followed. Some of the girls were far from ill-looking; one of them, indeed, we were told, was noted as the beauty of North Greenland, though that tells an indefinite tale, beauty being in Greenland nothing very positive, but a great deal comparative. We now return to the "Governor's," where, after imbibing more rum and water—plebeian but comforting beverage in the cold June night, for the sudden warmth which had tempted forth the mosquito has now given way towards midnight to a dismal chill, which the wind, blowing from the ice-covered interior (see p. 58), has intensified—we adjourn to our cheerless home in the little church. Just as we are preparing to sleep the slumbers of an Arctic diner-out, a rush to the rocks of a few idlers—in these settlements somebody seems never to go to bed—tells us that something unusual is in sight. It is past midnight, but the sun is above the horizon, as it has been for some weeks past, and will be for many weeks yet to come. A boat, with the white cross of Dannebrog flying, proclaims that it contains as passenger some officer of the Royal Board of Trade, which controls the Crown monopoly of the trade and government of Greenland. It turns out to be no less a personage than the Royal Inspector of North Greenland, a great—a prodigiously great—personage—in Greenland. He is on his tour of inspection, and everybody, from the poor Colonibestyler down to the humblest seal-hunter, will experience a commercial keel-hauling to-morrow from the magnate in skin trousers and uniform coat—fit emblem of the union of the hunter and buccanerie life which Greenland consists of.

"Going to bed" with us means lying down rolled in a blanket on some dogskins on the

* Danes.

† Englishmen.

floor. The sun streams in through our little windows, though it is now past midnight, and little fur-clad folk, who are yet prowling about the settlement, peep in to inspect our domestic arrangements. As I write, a vision of brown greasy faces, with a shock of black wiry hair in their eyes, rises up before me. Troops of wolfish dogs make night horrible with their "long cry," and we are awoken at intervals with their dismal chorus, until at six o'clock the ringing of the workmen's bell is the signal for the renewal of this hyperborean music, and for sleep being banished from the eyes of the drowsy strangers in the "kirk-loft" of this little settlement.

VIEW OF CHRISTIANSHAAB, NORTH GREENLAND. (From an Original Sketch.)

So ends a typical day in Greenland. One end is very much the same as another—some are duller, few are more lively. From this it appears that Greenland is pretty much like the rest of the world—rather given to scandal and tittle-tattle, and with a little, just a very little, double-facedness. The "colonists" have quite a mania for writing letters to each other on all possible occasions, and though they are publicly on terms of the utmost cordiality, yet it is impossible, in the interest of truth, to deny that these good people have a disagreeable habit of abusing each other privately—a knowledge which materially detracts from your belief in the *couleur de rose* aspect of things. Summer moves along; the snow has all disappeared off the low grounds, except in shady hollows, and the sun shines day and night with unwonted brilliancy. The *heat* gets sometimes oppressive, though occasionally the cold gets more intense than becomes a July day. One's impression of Northern life, from its very

isolation from all disturbing influences, remains long in the memory, but our note-books of these days convey an even more vivid idea than the mere recollections left after several years have passed away. For months and months we have heard nothing from the outer world, and we are quite content to do at Rome as the Romans do. We are very little interested in what may be going on in Europe. We care nothing for the *Times*, and politics disturb not the quiet equanimity of the sojourners in high latitudes. Intensely concerned are we, however, in the little affairs of the settlement, where, in the service of science, we have fixed our home. It is a matter of paramount importance to learn that Matthias has killed a bladder-nosed seal; that the ice is pouring out of the "ice-fjord," shutting off communication by sea; how Kumagdlat's dog-team all died last week; or how the cooper's half-breed daughter is to be married next week to Jens Jensen, the famous seal-catcher of Christianshaab (p. 133). Our life is a materialistic one—"sweetness and light" being entities which a Greenland settlement tends to sparingly impart to existence. In sunshine and in storm we perform our appointed work, enter records, and make observations, and enter records again, which will be afterwards embalmed in "Memoirs" and "Transactions" unheard of in Greenland, and little dreamt of by the simple-minded people who watch us as we make them, with a strong suspicion as to our sanity.

Sometimes the monotony of our lives is varied by an excursion to a distant settlement, when the rusty old cannon in front of the Colonibestyrrer's house are fired, and the Danish flag is run up; or we leave on some lonely voyage, in a flat *umiak*, or skin-boat, up some of the deep fjords, until the icy wind, blowing from the great interior *mer de glace*, meets us, and the water-fowl, which breed in countless numbers on the cliffs, scream at us in derision as we turn homeward in baffled sadness at our failure to penetrate to the mysterious eastward. Our life is varied by such incidents from home, and in our quiet settlement a white stone, or the contrary, marks a day of dog's-meat trading in behalf of our ravenous team, or the sensation of Johannes bringing conviviality in the shape of a new cask of beer, a guileless but most acceptable beverage, which he has brewed out of hops and malt brought from Denmark. At other times there is a funeral winding over the rocks, followed by the doctor's old dog-driver in the tail-end of the procession. To vary matters, our light-hearted factotum, Carl, who scents out any festivity from afar, strikes envy into our hearts at breakfast by the relation of the gaieties of the ball at which he had assisted in the storehouse the night before, and with an account of the mighty seal-catchers and white whale-fishers who were there. Everybody is known by sight or by name, and certainly every one is acquainted with us. Of course there are the little local jokes, but as a very little wit goes a long way in Greenland, and a poor jest, like ill news, travels apace, it is doubtful if any of them would bear repetition. I am afraid our talk smacked terribly of seals, icebergs, and train-oil generally. Sunday makes a break in our quiet life. I return from a long ramble up some mossy valleys, at two o'clock in the morning, and sleep rather late. Nobody thinks of locking their doors, and people walk in and out of our establishment with the most innocent familiarity. Accordingly, about nine o'clock, I am awoken by a preternaturally long and wontedly mild Eskimo catechist shaking me in bed, and presenting a written paper as long as an unpaid tailor's bill. It is nothing more alarming than a rambling intimation from the priest "To the Danish residents who, by the grace of God,

are in ——” to the effect that there would be Danish church to-day, and winding up with the announcement that, “as usual, the time would be regulated by the Colonibestyrrer’s watch,” from which it appears that the “bull’s-eye” in question is the only one in the “colonie.” It is, however, so highly thought of that the priest ventures to dispute the accuracy of our chronometers, because they disagree with *the* watch. After service, the people enjoy themselves as best they can, and the day generally winds up with a supper at the “Governor’s,” and a ball in the storehouse. I often wondered what could be the ideas regarding things non-Greenlandic of the Danish children born in Greenland. While working at my table I am visited by troops of chubby, healthy-looking little ones—Knud and Helga, and little Sopheus, and all the little skin-dressed Jenses, Hanses, and Peders of the settlement; while a wondering group of Eskimo children (p. 140) peep in timidly at the low window. They chatter away to me in Danish, not supposing that it is possible for any white man not to perfectly understand that language. To all of it I reply at intervals “ja” and “nae,” and they seem perfectly satisfied. Little Sopheus, in his well-rubbed sealskin trousers and jumper, perches himself on the highest chair, and is very assiduous in handing me my paper and other requisites. He is, I dare say, telling me a wonderful story, but I cannot appreciate it. They bring me handfuls of flowers, and wonder if I eat them,—all things have that *raison d’être* in Greenland. They are a strange assemblage, these children of the far North. All the rude sports of childhood are unknown to them, and they look up stupidly enough in your face when pictures of a horse, a carriage, a tree, or any other thing out of their limited knowledge, is shown them. Their talk is of seal, and whale, of tatterak, the kittywake gull, or of apalearsoak, the little auk, or of Peder’s big neitersoak or bladder-nose seal, or of Paulus Rosbeck’s *umiak*, which has come in from Omenak (p. 129). All these things they seem to know well enough about, for strive as their parents will, they manage to associate too much with the native children, and learn a trifle too rapidly their language and manner of talking, as well as their ways of thinking about everything. Their parents will tell you that if they are sent to Europe they get peevish and discontented with their lot, and weary to get back to Greenland, and their old associates and scenes. Almost every autumn I meet in Copenhagen ladies, associating in the best society of the polished Danish metropolis, and accomplished even beyond the wont of their fair countrywomen, who were born of Danish parents in Greenland, and who passed the early years of their life there. They never conceal their belief that though Denmark is no doubt an admirable country for those who know no better, yet that they weary for the free life and the wild scenes of the far North. Some years ago two young ladies went to Greenland on a visit to their relatives. Both returned a second season, and one of them married and settled down among the icebergs, to the astonishment of the fashionable folk of Copenhagen, and the supreme disgust of many of the young gentlemen thereof! In Greenland the white letter days are not many. The King’s Birthday (8th April), and Bede’s Day, or St. Bede’s Day (8th May), when everybody, by sea and land, makes it a point of having something better for dinner, and drinks more rum and water than usual—albeit there is never any great dereliction in that item—are the chief days of merry-making. But the greatest event in the year in each little settlement is the arrival of the annual ship or ships, which bring out the stores and take home the oil, ivory, and furs for the year. It is a

general holiday as long as the ship stays. The children go to no school, and the whole population is too busy gaping at the wonders of the ship from the cliff over the little harbour to go seal-hunting or fishing. With *the* ship come out the toys of the children, the finery of the women, and the books, letters, and newspapers of everybody, from the home they leave behind them on the other side of the Atlantic. It is also a season of enjoyment for the natives, though, indeed, the male portion do not always appreciate the attention paid to the native beauties by the interloping foreigners. However, self-respect and jealousy, when this could be a virtue, is not a marked feature in the Greenlander's character. While the ships are at the settlement, the Danes seem to spend most of their time in going round picking up news and gossiping with the captains. Unless there be some extraordinary attraction, the file of newspapers is neglected. Meantime they gain the tale of how the world has been moving, during the past year, from the captains; but no sooner does the last ship sail than the parcel of the *Dagsblad*, *Telegraf*, or *Berlingske Tidende* is taken down from the shelf, and, with wondrous self-denial, some of the philosophical residents limit themselves to two papers *per diem*. In the winter there is the seal hunt, and even sometimes a wandering Polar bear (p. 137), which has put the naturalists to shame by wandering about in the winter, in spite of their assertions to the contrary, may be surprised and swooped on by the owls, which, with the hawks, ravens, and ptarmigan, are the only feathered winter residents of Greenland. Books and letters fill up the leisure time during the winter, and visits paid on the dog-sledges to the neighbouring settlements relieve the monotony of the months of darkness. Indeed, in some of the journals, written early in the century by the old missionaries, the demand on their hospitality by the numerous visitors is complained of as making terrible inroads on the winter provisions, which in those days there was little opportunity of renewing when exhausted. At such settlements as Julianshaab (p. 141), and others in South Greenland, though the country is pleasanter in the summer, and excursions up the fjords are really charming,* yet, owing to the inclement weather and the want of sledging ice, they are shut out from the rest of the world for seven months in the year. The Danes are at home rather a slow-moving race. In Greenland they are conservative to the last degree, and a Greenland "foggy" is a foggy indeed. In 70° North latitude there are plenty of them. For instance, there lives—or used to live, for I speak of years gone by—an old gentleman at Omenak, who had been sixty years in the country, and always loudly declared that in his youth the summer days were clearer, and the winter ones colder, the icebergs bigger, and everything different than in these latter degenerate ones.† In the summer, half of the Danish families, and most of the Eskimo ones, often run short of fresh food—even of seal flesh in bad weather—and have to resort to salt pork, young sea-gulls, and a few fish, while during the winter there is a superabundance. Yet they never think of an ice-house, though the shores are strewn with fragments of bergs, and the bays are

* See "Sketches of Life in Greenland," by S. N. R. (*Geographical Magazine*, 1876.) We do not perhaps reveal any secret when we state our belief that it is to the accomplished wife of the former Governor of South Greenland, and late President of the Royal Greenland Board of Trade, we are indebted for these pleasant sketches.

† Did not old Nestor, in the boyhood of the world, lament after the same strain?—"I never saw, nor shall I see, such men as Perithous and Dryas, shepherds of the people; and Ceneus and Exadius, and the godlike Polyphemus, and Theseus, son of Ægeus—men like the immortals themselves."

DEATH OF THE POLAR BEAR: A WINTER SCENE IN NORTH GREENLAND.

full of gigantic ones. In most cases the Eskimo are even too improvident to lay by a store of any kind for an evil day. If you suggest it, you will be told that "it is impossible; it has never been *before!*" This is the *finale* of any proposal of this description—it has never been done before, and, of course, cannot be done now.

The officials of the Danish Government in the far North are men of the highest respectability, and are not unfrequently retired officers of the army or navy. The country is divided, for the purpose of trade and government, into two royal inspectorates, styled respectively North and South Greenland. These inspectorates are divided into several colonies or districts, each presided over by a Colonibestyrer, who resides at the chief settlement, besides various "udliggers," generally a cooper or carpenter, who can be trusted with a moderate quantity of rum. The average value of the articles exported is under £50,000—oil being the item of greatest value, though hair seals bring more than £5,000, and blue foxes (p. 128) fetch nearly an equal sum. After paying the cost of Government, and the nine vessels which are employed in the trade, there will remain a profit of more than £6,000, not including the interest of £64,426, at 5 per cent., which represents the capital which the Government has sunk in Greenland, and the royalty paid by the private company which work the cryolite mine. The net revenues from the trade for the last century have been estimated at £166,000. From the gross revenue a proportion is set aside to be expended by the Parish Councils, called *Missuisat* or *Parssisut*, elected by universal suffrage, for the support of the aged and infirm, the widows and orphans, and for such necessary public works as, on a very small scale, Greenland requires. By the last census there were 300 Europeans in Greenland, and 9,757 natives, though many of these were of mixed blood. The population has for some years past increased by 56 per annum; the women outnumbering the men by 630. Altogether there are in Greenland 176 inhabited places.

From what we have said it will be apparent that summer life in Greenland is existence in no "Land of Desolation," as John Davis designated the country. Our space will neither permit us to describe further the amusements of the long day in the far North, nor even to touch upon winter life, which we have now and then mentioned. Suffice it to say that to those who have made up their minds to make snowy Greenland their home, there is nothing very forbidding in the country. Many of the residents, who have only looked forward to passing a few years of comparative exile in that country, have returned to end their life there; and few who have ever passed no matter how short a time in the Danish Arctic provinces, but have looked back with satisfaction and even gladness to the life among the icebergs, the glaciers, and the Eskimo. An anecdote is often told in Greenland *à propos* of this, and with it I may conclude these brief sketches of Danish Greenland life. A Moravian missionary, after a long residence in Greenland, returned to Saxony. Naturally his friends congratulated him on again fixing his residence in his native land, and supposed that he would find Germany an agreeable change to Greenland. On the contrary, he replied, he did not—life "at home" was too dull for him. In answer to his astonished friends, he explained the seeming paradox. "In Greenland there was always something to amuse or interest one. Now it was seal-catching which was the subject of interest—now reindeer hunting—now the bladder-nose arrived on the coast—now the saddle-back seal.

Anon the whale was blowing in the offing—at another time the narwhal appear in droves off the coast. The long winter had scarcely become wearisome before the long, bright summer was come. Then there were the ships arriving from Europe—other ships leaving. The absence of news from Europe was compensated for by the pleasure of receiving so much every year all at once. In fact, in Greenland there was always something new. In Saxony, on the contrary, one day was like another—wearisomely monotonous!”

THE VOYAGER'S LIFE IN THE FAR NORTH.

The whaler's route, and the whaler's general routine of existence, we have already briefly sketched. His life is by no means monotonous, and would have been a state of delirious excitement for the old Saxon priest who disliked the dulness of German village life. The whaler's voyage across the Atlantic is generally calm, and no sooner does he reach the Greenland coast than his mind is kept continually on the stretch. Navigation during the long daylight, without being absolutely dangerous, is yet not unattended with that potentiality of risk which gives zest to a voyage in the smooth waters of Baffin's Bay. There is scarcely an hour of the day or night during which ice does not grate against the vessel's side; any one who will take the trouble of examining a whaler arrived from the North will have no difficulty in seeing in her scarred timbers the witnesses of her encounters with the "thick-ribbed ice" of the regions she has been navigating for so long past. Passing "the bay" (see p. 111) is an exciting time, and "the bay" is no sooner gained—supposing the vessel is not destroyed—than the whaler is on his battle-ground. Once there, there is an unpleasant uncertainty as to how long the seamen are to be allowed to be in bed. The "watch" may have just turned in, when a cry of "A fall! a fall!" will turn every one out of bed, his clothes in his arms, and while the boats are being lowered, and even pulled off, the men will be hastily dressing piecemeal. Every man is interested in the success of the voyage, and the certainty that his exertions will help his purse renders laggards rare phenomena on board a whaler. The "making off" is a stimulating labour, slightly unpleasant at first, but in time ceases to be so, for fresh blubber has really no smell; while the excitement of "pulling on to" the unsuspecting whale, harpooning it, and finally, often after many hours of toil killing the gigantic animal, is an experience before which every other in the annals of the chase pales. Visits from or to the Eskimo, or a sail in search of whales about comparatively unknown inlets, and along shores romantic in their misty obscurity, vary the monotony of the "off-time," when "fish" are scarce, and the captain more and more desponding every time he comes down from the "crow's-nest," and more and more inclined to pay greater attention to that hot rum and water which is not unfrequently—though more rarely now than once—the weak point of the whaler. There are snowy days and many dull hours, in which the old books are read over and over again, and the last Dundee newspaper, which was just put on board before sailing, spelled through and through from the first advertisement to the last. Venerable tales—which were tolerably fresh six months ago, though stale enough now—are told once more, the listeners keeping up a faint show of pretending that they are new, though nobody is deceived as to the patriarchal age of the jest. A very small joke goes a long

way in Baffin's Bay—as it does in Greenland—nor is the quality of the wit particularly strained. The stories are all excessively local, as might be expected among men of one profession, all from one port, and few of whom have ever followed any other branch of a seafaring life. Many of the whalers have never seen corn grow, and have forgotten what a flowery land little Britain is. Snow and ice, "fish" and "Yuks" (Eskimo), "unies" (narwhals) and "sea-horse" (walrus), are the favourite subjects of conversation when a party of whaling captains meet together over their grog, or to consult about their

GROUP OF GREENLAND ESKIMO CHILDREN. (From Original Photographs.)

affairs. On a smaller—and probably a rougher—scale, the same conversation goes on in the "galley," though, contrary to what might be expected, "society" in the "'tycen-decks" is by no means very democratic. The "harpooners" (or "harpooneers"), as they are invariably called, have a mess to themselves, a boy to wait on them, to bring their rations from the galley, and their grog from the steward's pantry; and altogether are very great men. They are, in fact, warrant officers, who may look to be captains at no distant period, provided that they are "scholars," and can "pass the Board" in Dundee. Then there is the "speetioneer"—or blubber king, who superintends the stowage of the cargo—the sail-maker, carpenter, and cooper, who, being in a manner civilians, are only tolerated by the magnates alongside of whom they have a relative rank, and by whom they are esteemed very respectable men—in their way—though not bred to the sea and to "the trade" from their

youth upwards. The "loose harpooner" is also somebody in his own esteem and in that of the boat-steerers. In due time he will become a full harpooner, and then a boat-steerer will take his place, and a line manager—or sailor who looks to the running out of the line after the whale is struck—will succeed to his dignity and pay. There is then the democracy of the seamen, the ship's apprentices, and lowest of all, the "green hands"—generally Shetlandmen, or "shoremen," who have been induced by necessity, or more frequently by curiosity, to try a seafaring life for a few months. But as they can neither "reef, hand,

VIEW OF JULIANSHAAB, SOUTH GREENLAND. (From an Original Sketch.)

nor steer," and can do little better than pull boats after a rude fashion, stow blubber, and clean decks, their pay is small, and their dignity less, while their capacity for bearing jibes and jeers must be necessarily great if they wish to lead a moderately peaceful life, and are emulous of smoking many pipes by the cook's fire.

The food on board a whaler is plentiful but rough. No class of seamen are better provisioned or more sumptuously grogged. The number of meals taken in the day is generally three; but if whales be killed, they are simply indefinite. At no matter what hour of the day or night a whale is killed, a meal is the invariable preliminary to "making off," and rum is served out to the men with a liberality unknown, and which would be dangerous in lower latitudes. In addition to the ordinary articles of seamen's dietary, the whaling sailors have frequently fresh messes. Ducks, and, above all, sea-fowls—such as

guillemots, loons (the Danish *lomvia*), dovekies, and rotjes—are among the most familiar articles which festoon a whaler's rigging. After they have hung sufficiently long to get tender, they are made into "scouse," "sea-pie," and other similar mysterious dishes, in which the stout stomach of the seafaring man delights. The cabin table is well supplied with preserved meats, hams, and fresh meat, which preserves very well in the rigging throughout the voyage. It is tender, and possibly even somewhat high-flavoured towards October. But that is a trifle to hardy appetites. Altogether, a whaler's life in the far North is not the least desirable phase of a sea life. He is fed better, he lives in a healthier climate, has more food, and generally better, and more money and less monotony than sailors in almost any other employment. He is at once a seaman on the Atlantic and a "fisherman" in Baffin's Bay, and the conjunction of employments is apparently pleasant, for few who ever enter upon the employment desert it, and many follow it from father to son.

The yachtsman's life in the Arctic seas we have already more than once touched on, and need not revert to. Most of the amateur sailors within the Arctic circle visit the North for hunting or for amusement. Occasionally they vary it with an attempt at amateur exploration, but few of those who have attempted it have, either from want of training in themselves or their crew, been so successful as to call for particular remark.

The explorer pure and simple has a graver work before him. Most frequently he is a stranger to the North, and in this case everything is new to him, and what would be novelty to any one becomes doubly so to the enthusiast, whose mind has for years been dreaming of what is now a reality. His mind is daily tortured with anxiety, or the disappointment which makes the heart of man bitter, for in the ice-choked seas of the North, more than in probably any other part of the world, is the truth of Pliny's maxim demonstrated—"That on earth there is nothing certain, unless that nothing is certain;" or he is exulted by hope of accomplishing what no man has yet accomplished, as his vessel gets free from the icy barriers which a few hours before rendered all progress impossible, and once more sails in an open sea and free. Again he is stopped—again he is free; hope and despair alternately excite or depress him, until the inevitable winter arrives and imprisons him for five or six months. His life is a gambler's life. He is throwing for a great stake, and yet his success or his failure is in many respects independent of skill. The Arctic explorer's success or failure is to a great extent dependent on what, for want of a better name, is called luck. He may be the best and boldest seaman who ever trod a deck—a Nares, a Markham, or a Stephenson—and the ice may—as the voyage of the *Alert* and *Discovery* only too completely demonstrated three hours after sighting it—render his efforts futile. On the other hand, the most indifferent of seamen may meet with open water, and sail to a latitude, and attain a reputation, denied to his predecessor, who really deserved the applause of the world a great deal more. In a word, failure in the Arctic regions does not necessarily mean want of skill or perseverance, any more than success demonstrates the possession of these qualities. It was this alternate hope and fear that actuated the old navigators—men of whom it might be truly said, that they "feared it not, the spirit which dwelleth in the land of ice and snow." Whether they sought for a North-east or a North-west passage to Cathay and Cipango; whether, in other words, they dreamt of reaching India, China, and Japan by doubling the northern

152

end of Europe and Asia, or of America, they were buoyed up by the same alternate hope of success and fear of failure. They thought that the continents might terminate northerly in a narrow point, as they knew America did in the south, and that after doubling this cape they might reach an open sea and a free. Thence they would sail into the Pacific of Balboa, down by the lordly Spanish Main. There would they take tithe of the good things there to be found—they would freight their ships with gold dust in the land of Cathay, or with diamonds and rubies in the mysterious Indies of the mighty Genoese—ballast them with piles of Spanish doubloons, with sacks of Portuguese milreis, with bushels of pieces of eight! Seekers after shadows they were, no doubt, all of them—dreamers of dreams. But they sought after shadows which in their eyes were very substantial, and dreamed dreams which even now we acknowledge were grand old dreams. Their enthusiasm consoled them for all misfortunes, and buoyant hope carried them forward under repeated failure. When the thick ice grated against their vessels in the cheerless North, and the chilly wind caused them to shiver in their furs, they whispered unto their souls to take courage; for before the flowers bloomed again in merry England they should be in fair land, where coral reefs fringed the palm-shaded shore, where the soft tropic winds were wafted seaward laden with the odours of spices, of myrrh, and of frankincense; where the dark-eyed maidens wrapped themselves in jewelled robes; where the bondsmen were clad in goodly garments!

Wintering in the Arctic regions for exploring ships has now been almost reduced to a science, from the hour the ships get frozen in, housed over, or banked up with snow. Health and amusement are carefully attended to by warming and ventilating apparatus on board the ships; exercise, theatres, schools, newspapers, scientific observations, and abundance of other methods of entertainment, which must be familiar to many of my readers who remember the varied articles of outfit put on board the *Alert* and *Discovery*, and the still later descriptions and sketches which were published after their return. Yet still the winter is dreary enough—the long darkness, combined with the uncertainty of the future, and a frequent attack of home sickness, making winter life on board an exploring ship, even under the best of auspices, not very desirable.

Whalers are occasionally frozen in if they delay their stay too long in the Arctic regions, and though they are generally provisioned for twelve months, yet, in any case, they suffer greatly. The hardships of the beleaguered *Diana*, of Hull, in the winter of 1866-7, must be still fresh in public recollection, and how she gradually floated southward, out of darkness into light, arriving on the coast of Shetland in early spring with half her crew dead or scurvy-riddled. Others, chiefly American vessels, winter in Cumberland Sound and that vicinity, near the mouth of Davis' Strait, in order to catch the whales on their spring migration. In that latitude, though the winters are gloomy and cheerless to the last degree, yet there is no continual darkness for several months as there is further north. At one time walrus hunters used to winter on Spitzbergen, and even Novaia Zemlia. These men were chiefly Russians or Norwegians, but though of iron constitution, they suffered terrible hardships. Some seamen have also wintered on Jan Mayen, on which was a volcano, but were unable to survive the winter; * though the Austrian Meteorologists did so in 1882-3.

* Pinkerton's "Collection of Voyages and Travels," Vol. ii.; Laharpe, "Historie Générale des Voyages," Vol. xvi.; Harris' Collection, Vol. ii.; Dufferin's "Letters from High Latitudes," &c.

THE NATIVES OF THE ARCTIC REGIONS.

Hitherto we have only spoken of the Arctic regions as a dreary land into which explorers penetrate, and a few Danes live for longer or shorter periods. But forbidding as the country is, it is the home and the native land of thousands of people, civilised and savage, who prefer its solitudes to the more inviting countries which lie to the south of it. Among these we may be expected to include the Icelanders. Iceland is, however, an essentially European island, and will be sketched at a later period when the North Sea isles are the subject of a chapter. Indeed, only a small portion of the country is within the Arctic regions of the geography, and the very title of the country is a misnomer, as we have already pointed out. It is a dreary enough lava field, however, only a few dales and flat districts near the coast being inhabitable—the 72,000 or 73,000 inhabitants dividing their time between tilling a little land, rearing dwarfish sheep, cattle, and ponies, and capturing, salting, and drying the fish which are found in such abundance off their shores. Of late years the scenery of Iceland, its geysers and volcanoes, as well as its easy proximity to Europe, have made it a favourite haunt of the ubiquitous summer tourist, so that the inhabitants have, in addition to their natural resources, the additional one of preying on the birds of passage who come to see them and their island. The island was discovered and settled in the ninth century by emigrants from Norway, no aboriginal inhabitants having ever existed here. From the earliest period these *émigrés* were distinguished for the turbulent character of their disposition, their love of freedom, and their love of letters. While the rest of Europe was steeped in ignorance, the Icelanders cultivated letters, and their sagamen and skalds composed the popular histories which have since received so much attention from modern scholars. The same love of learning distinguishes the inhabitants at the present day. They still speak the purest dialect of the Danish, and have numerous works either written in or translated into their mother tongue. They are hospitable and kind, though primitive in many respects, and dress in a picturesque and rich costume, of which they are immensely proud (p. 145). They are said to inherit the character of their forefathers, and give an endless amount of trouble to Denmark, which now owns the island. It is, in fact, the Ireland of the little Scandinavian kingdom—the inhabitants bearing, in more senses than one, a remarkable likeness to the people of the Emerald Isle. It ought to be added that they are honest and moral even beyond the high standard of the Danes; and that though poor, it is rare to find one of them who cannot both read and write. They are very patriotic, and are fond of studying the history of their country, in the ancient sagas and poems. At one time they numbered 100,000, but in 1880 the census showed only 72,438, and since that date they have been decreasing, numbers now emigrating to the United States and Canada, the people being discontented with their lot, notwithstanding the liberal constitution granted to them by the Danish King on the 1,000th anniversary of the settlement of the island in 1874. If these colonists be successful, many more will follow, so that in time we may expect to see the ancient glory of the “island grand” fade and disappear. Regarding its scenery, and the quaint customs of the inhabitants, much information is now made accessible to the English reader by the works of Symington, Forbes, Burton, and numerous

other writers of greater or less note. Of the Hudson's Bay officers in the far Northern beleaguered forts of the fur countries we shall speak in succeeding chapters, and the life of the Siberian residents—free or bond—we may have occasion to touch on in a future volume.

The aboriginal inhabitants of Polar lands we have more or less fully spoken of in another and companion work. The hardy men who have chosen the Arctic regions for their home are the Eskimo (pp. 73, 77, 109, 140, &c.), the Samoyedes (Plate V.), the Lapps (p. 32), the Ostiaks, and similar allied tribes, who roam—as in the case of the Eskimo—over

ICELANDIC FEMALE COSTUMES.

the whole stretch of Arctic America, and even part of Asia; and in the case of the others, over the northern parts of Europe and Asia. In many respects they are similar in appearance and habits, and all of them fight a stout battle for life with the iron skies they live under. Indeed, it is a little difficult at first sight to distinguish a Samoyede from a Siberian (pp. 36, 37), and either from an Eskimo. The habits of men are moulded by the physical agents by which they are surrounded. Hence the Northern men, though they may differ in religion and in minor customs, will have a general similarity of life, whether they are known as Eskimo or Kamtskadal, Ostiak or Koriak, Lapp or Vogul—whether they live in the cold continent of Europe, in Northern Asia, or in those cheerless regions.

“——— where the moving isles of winter shook
By night with noises of the Northern sea.”

CHAPTER VII.

THE FUR COUNTRIES OF NORTH AMERICA.

IN the winter of 1869, some time about Christmas, there was a commercial transaction enacted at Ottawa, the capital of the then newly-created Dominion of Canada. A clerk handed over a few Treasury Bills, and a factor received them. Three hundred thousand pounds was their amount; but with the payment of that sum a famous old company of merchantmen sank into mere hucksters—buyers and sellers of furs—and the last of the great monopolies ceased to be. The sum was paid by Canada as the price of the cession of the political rights and privileges of the “Honourable Company of Merchant Adventurers trading unto Hudson’s Bay.” From that day forth they ceased to have any power over the huge tract of North America, usually styled Rupert’s Land, or the Hudson’s Bay Territories, and became, in the eye of the law, as the rest of the traders who did their business in the wild forests, prairies, and Arctic-like wastes that stretched on to the Frozen Sea under the rule of the land that Jacques Cartier explored. The Hudson’s Bay Company were as nothing compared with the East India Company; but yet, in their own small way, they were a close imitation of that lordly corporation. It was a mere commercial association which, with a few clerks, ruled more than half of North America—a territory larger than all Europe—after a fashion despotic and irresponsible enough, and yet, on the whole, just, wise, and to the honour of the English name, a mere joint-stock company of traders, who yet, at their own sweet will, under their own banner of *Pro pelle cutem*—“skin for skin”—declared war and made peace, and without a single soldier held in awe and loyal subjection fierce tribes of Indian warriors, all across the broad continent of America. The last of the old proprietary governments—they saw the gorgeous career of the East India Company, and its decline and fall. They witnessed Louisiana ceded by his most Catholic Majesty of Spain, and the Seigneurs of New France become subjects of Great Britain and again of the new-born Dominion of Canada. They witnessed the ruin of the Darien enterprise. They saw the South Sea Bubble burst, and a dozen rivals come to nought. They remembered when all North America consisted of the “plantations of his Majesty,” they remaining loyal and attached when the colonies broke from the mother country. They survived eleven sovereigns, and died in the reign of the twelfth. In a word, the history of the Hudson’s Bay Company is the history of the fur countries and fur-trade of North America. Wherever the furs were best there they reigned; wherever the trade was most profitable their forts, and their all-embracing monopoly, extended. The American Fur Company had posts on their border lands, and a score of private traders lived on the offpourings of their hunting ground. But at the fulness of their power the Hudson’s Bay territory consisted essentially of the fur countries of North America. No description, however brief, of the interesting border country between the Arctic regions and the land of corn, of cotton, and of wine, can be written without a sketch of the rise and fall of the great Fur Company. In its day it was the fur-trade, and it ruled and explored the fur countries.

We—and by *we* I speak of those who remember the Company before it ceased to be a political power—who knew the Company in its palmy days; who drank its good wine and ate of its salt; who hobnobbed in its picketed forts with the sturdy factors at great dun oaken tables laden with beaver-tails, buffalo-tongues, and huge roasts of moose and of elk and of caribou; dishes of tender antelope, and luscious salmon from the rivers of its empire of territory; ptarmigan from Hudson's Bay, *oulachan*,* most delicious of fishes, from the Naas River, and snowy hares from the Eskimo, along the shores of the Arctic Sea; we who shared its stirring enterprises, and floated down far western rivers in its birch-back canoes; who have been honoured by seeing our names carved on tamarac "lobsticks" on the Albany River, and on cedar ones on the Columbia or Fraser, in return for *répales* of rum, tea, and tobacco, largessed unto its voyageurs; we who were, in a word, *of it*, have pleasant memories in relation to the great corporation, and may be excused if we linger fondly over its history, even at a time when the world—when the world has not forgotten it—is disposed to hold its achievements cheaply, and to dwell with undue severity upon its misdeeds and shortcomings.

THE HUDSON'S BAY COMPANY AND THEIR LANDS.

About the year 1667 there was living in a dull set of chambers in the Temple a retired soldier, who, after having done knightly service for his Royal uncle of the "sacred memory," was busy with endless chemical experiments, never productive of much good to the world, and rather injurious to the slender purse of "Fiery Rupert of the Rhine"—the gentleman in question. He had always been on the eve of some great discovery, but had never made it, for "Rupert's drops" is but a slender peg on which to hang a chemist's reputation; and now his Serene Highness the Prince Palatine of the Rhine was fast settling down to being a sort of Mæcenæ to every needy adventurer who found his way with a plausible scheme to the further side of Temple Bar. Rummaging through the dusty tomes of the Temple Library, he read how in 1252 Marco Polo, the great Venetian traveller, saw in the tent of the Grand Khan of Tartary furs and sables "brought from the North, from the land of darkness." The idea struck him, that could these furs be got now, what a splendid scheme it would be. Just then he was waited on by a man who had travelled much in North America, and was well acquainted with the wild Indian tribes not far from the shores of Hudson's Bay. This was M. de Groiseliez, a Frenchman, almost as full of ideas as the prince himself, but, on this particular occasion, occupied with one more than ordinarily feasible. He fired the imagination of the Palatine by his pictures of the exceeding abundance of fur animals on the shores of Hudson's Bay, and the great profit which could be made from them. The result was, that after an experimental trip had proved successful, the influence of Prince Rupert succeeded in forming a joint-stock company of noblemen and gentlemen for the purpose of pursuing this fur-trade. Furthermore, his cousin, the king—for what back-handed *douceur* history does not inform us—granted to this company of "Merchant Adventurers trading unto Hudson's Bay" a charter investing them with a monopoly of the furs and lands of the borders of all the streams flowing into Hudson's Bay not occupied by the subjects of any Christian prince; and, furthermore,

* The Pacific Smelt (*Osmerus pacificus*).

the privilege to make "war and peace with the people not subjects of any Christian prince." This was dated the 2nd of May, 1669. The adventurers gradually extended their enterprise, until, 190 years later, they possessed 155 establishments, in charge of 25 chief factors, 28 chief traders, 152 clerks, and 1,200 other servants, besides having a large number of natives under their control. These trading districts (thirty-eight in number) were divided into five departments, and extended over a country nearly as big as Europe, though thinly peopled by some 160,000 natives—Eskimo, Indians, and half-breeds.

VIEW OF YALE, ON THE FRASER RIVER, BRITISH COLUMBIA, IN 1863.

Of course, such a successful Company as this was not long in being opposed, and the story of the rival traders is not the least interesting or smallest item in its chronicles. Previous to the year 1783 the adventurers had many petty rivals to withstand, but these they chiefly got the better of by fomenting divisions and animosities among the Indians of the interior, so as to terrify any one from engaging in trade in that quarter. This had been an old trick of theirs when any Indian tribe was likely to combine with another against them, and now they turned the same time-dishonoured weapon against their commercial enemies. Nor were they at all scrupulous as to the means by which they ousted their rivals from their domains. There stand on record two cases in which ships had attempted to enter Hudson's Bay for the purpose of trade by sea. These the Company seized and drove ashore, pleading—so, at least, runs the tale—that they were lost by stress of weather.

FUR ANIMALS : BEAVERS (*Castor canadensis*).

THE COUREURS DES BOIS.

The French fur-traders from Canada also not a little annoyed them. The St. Lawrence ran through the heart of a country which, in the times we speak of, was rich in fur animals, the settlers being few and cultivation still rarer. The fur-trade was

agreeable to the light, volatile disposition of the French *habitant*, who thus in time monopolised the trade outside the British territories proper, and became, as he is in the person of his descendants to this day, active—though then he was a somewhat more important personage than he is now—in the collection of peltries. The French had not only great companies which, in importance in those days, rivalled the Hindson's Bay traders, but numerous private individuals were engaged in the same lucrative traffic. Indeed, "La Compagnie de la Nouvelle France" was very much the same in constitution as that of their subsequent British rivals. They had the disposal of all settlements formed or to be formed in Canada, or New France, as it was then called, with the power of fortifying them, or of making war or peace just as they thought most conducive to their interests. So anxious, indeed, was the French King to back up this association, constituted in 1628, that he made it a present of two large ships, and raised twelve of the principal members of it to the rank of the nobility. It was, however, a failure. Great enterprises of colonisation and exploration in distant countries have never been the strong point of our French neighbours. But the freedom which the fur-trade received from the dissolution of the monopoly of one great Company gave a mighty impetus to the efforts of individual adventurers. The licence of a savage life, and the profits derived from the trade, attached to it the "jetsam" and "flotsam" of France, Canada, and other countries, and all the waifs and strays which invariably turn up when anything which entails much labour and great danger, but promises a chance of profit and a certainty of adventure, is to the front. Furs, however, soon grew scarce in the vicinity of the settlements, and accordingly the Indians, accompanied by the *coureurs des bois*, or rangers of the woods, went with them on their expedition. Thus in time arose a class who became as well acquainted as the savage trappers themselves with the best hunting-grounds, and who were able, by their friendship with distant tribes, to persuade them to bring their peltries in to the trading posts. Right and left—east, west, and north—the *coureurs des bois* extended their operations, until they travelled through a country peopled only by treacherous savages, more than 2,000 miles from the settled portions of Canada, their only means of subsistence what their traps or rifles could supply; their sole means of travel, the birch-bark canoes in which they navigated the lakes and rivers which formed their highway into the interior. Washington Irving, who in his youth had associated with old men who remember the later—though it may be the waning—glories of the Canadian fur-trade, gives a lively picture of the palmy days of these Gallic adventurers in search of peltry:—

"Every now and then a large body of Ottawas, Hurons, and other tribes who hunted the countries bordering on the great lakes, would come down in a squadron of light canoes, laden with beaver-skins and other spoils of their year's hunting. The canoes would be unladen, taken on shore, and their contents disposed in order. A camp of birch-bark would be pitched outside of the town, and a kind of primitive fair opened, with that grave ceremonial so dear to the Indians. An audience would be demanded of the Governor-General, who would hold the conference with becoming state, seated in an elbow-chair, with the Indians ranged in semicircles before him, seated on the ground, and silently smoking their pipes. Speeches would be made, presents exchanged, and the audience would break up in universal good humour.

160

"Now would ensue a brisk traffic with the merchants, and all Montreal would be alive with naked Indians running from shop to shop, bargaining for arms, kettles, knives, axes, blankets, bright-coloured cloths, and other articles of use or fancy; upon all of which, says an old French writer, the merchants were sure to clear at least 200 per cent. There was no money used in this traffic, and after a time all payment in spirituous liquors was prohibited, in consequence of the frantic and frightful excesses and bloody brawls which they were apt to occasion.

"Their wants and caprices being supplied, they would take leave of the Governor, strike their tents, launch their canoes, and ply their way up the Ottawa to the lakes. . . . The French merchant at his trading-post, in these primitive days of Canada, was a kind of commercial patriarch. With the lax habits and easy familiarity of his race, he had a little world of self-indulgence and misrule around him. He had his clerks, canoe-men, and retainers of all kinds, who lived with him on terms of perfect sociability, always calling him by his Christian name. He had his harem of Indian beauties, and his troop of half-breed children; nor was there ever wanting a louting train of Indians hanging about the establishment, eating and drinking at his expense in the intervals of their hunting expeditions."

In fact, by slow degrees, and sometimes rapidly too, the *coureurs des bois* descended, as did their successors, the Western trappers, into white savages. They lost in time a relish for white men's ways and white men's civilisation. But just in proportion to their love of a savage life did their use to the fur-merchants of Montreal increase. These merchants supplied them with an outfit, and dispatched them on their perilous errand. Fearlessly they would find their way up the great rivers and their tributaries, launch their frail skiffs on unknown lakes, and land wherever they saw the smoke of wigwams or the hope of beaver, careless or fearless whether their scalps might not have to pay forfeit for their temerity. "Sometimes they sojourned for months among their savage allies, assimilating to their tastes and habits with the happy facility of Frenchmen, adopting in some degree the Indian dress, and not unfrequently taking to themselves Indian wives. Their voyages would extend often to twelve or fifteen months, when they returned in full glee down the Ottawa, their canoes laden with rich cargoes of furs, and followed by great numbers of the natives. Now would come a period of revelry and dissipation—a continued round of drinking, gaming, feasting, and extravagant prodigality, which sufficed in a few weeks to dissipate all their gain, when they would start upon a fresh adventure, to be followed by fresh scenes of riot and extravagance."

Their conduct, both in camp and in town, became so disgraceful, that, to prevent their pernicious example corrupting the already indifferent morals of the Indians, the Government was induced, by friendly influence, to so far control the trade as to grant licences to pursue it. These licences for a time acted as a check on the lawless adventurers, as they were only bestowed on persons of good character, and in time as a reward to officers and their widows, who, not being of the material out of which *coureurs des bois* were made, sold their privileges to merchants and others, who soon brought about the old system again. In fact, though the generalisation may admit of exceptions, the rule was in those days that courage and morals did not go together. The "great army"

of fur-traders "swore dreadfully" in the fur countries, and committed all manner of other wickednesses, which are popularly supposed to appertain to the morals of those of loose tongues. The military posts, however, which were established in the interior, did a great deal to restrain the lawless trapper and trader, though the fur-trade appeared at this time to be quite an epidemic. Even the military officers were seized with it, and eagerly

NORTH AMERICAN PINE FOREST.

begged licences to engage in this lucrative branch of trade. They, however, conducted the business in a more orderly manner, and to distinguish themselves from the fur-trader *pur et simple*, designated themselves "commanders." Many of the scenes of the most stirring tales of romantic adventure, and the hairbreadth escapes from—and sometimes attacks by—the treacherous Indians connected with the early history of Canada are laid round these military fur-trading posts. Doubtless, many of these New World "commanders" were gentlemen of but indifferent reputation; but they were no worse, if no better, than the "gentlemen" who fought under Marlborough or De Villars in the Old one.

AMERICAN TRAPPER OF THE ARCTIC REGION.

THE NORTH-WESTERS.

Just about that time rose the great rival to the Hudson's Bay Company, which had hitherto led rather a sleepy if lucrative existence along the Arctic shores of Hudson's Bay. The Company had, moreover, as we have seen, been carrying things with a rather high hand, and not being very moral, or strikingly honest themselves, they could

scarcely have expected their rivals to be much more conscientious. Competition by the rival Canadian Fur-trading Companies—under the new British rule of that country—was carried to such a ruinous extent, and the natives were so demoralised with spirits, that the whole trade became disorganised, and the traders ruined alike in purse and morals. This could not last long; and now commenced the work of the great opponents of the Hudson's Bay Company, viz., the North-west Fur Company of Montreal, which was made up of a combination of the chief merchants engaged in the fur-trade of Canada. From small beginnings it spread until it became the most powerful organisation of the kind in North America. Hitherto the Hudson's Bay Company had only paid their *employés* by salaries; but now the North-westers introduced another system, that of advancing the chief officers by their merit into the condition of partners, in fact, the method now in vogue in the Hudson's Bay Company, which was roused from their fat lethargy by the activity of their opponents. In the year 1788, the gross capital of the new adventure did not exceed £40,000; but by exertion and energy it was brought in eleven years to triple that amount. The sleepy "Hudson Bays" were astounded at the magnificence of the new comers, and old traders yet talk, with something like awe, of the lordly North-westers. It was in those days that young Washington Irving was their guest, when he made his memorable journey to Montreal as the New England attorney's clerk. The agents who presided over the Company's affairs at head-quarters were, as might be expected, very important personages indeed. They were veterans, who had grown grey in the wilds, and were full of the traditions of the fur-trade. Round their grizzled heads were bound the laurels of the North. They were, in fact, a sort of commercial aristocracy in Quebec and Montreal, in days when nearly everybody was more or less directly interested in the fur-trade. To behold the North-west Company in all its state and grandeur, it was necessary to witness an annual gathering at Fort William, near what is now called the *Grand Portage* on Lake Superior. Here two or three of the leading partners from Montreal proceeded once a year to meet the partners from the various trading places in the wilderness, to discuss the affairs of the Company during the preceding year, and to arrange plans for the future. On these occasions might be seen the change since the unceremonious times of the old French traders, with their roystering *coureurs des bois*. Now the aristocratic character of the Briton—or rather the feudal spirit of the North Briton, for the "Maes" predominated—shone out gloriously. Every partner who had charge of an interior post, and had a score of retainers at his command, felt like the chieftain of a Highland clan, and was almost as important in the eyes of his dependants as in his own. "To him," writes the author of "Astoria," "a visit to the grand conference at Fort William was a most important event, and he repaired there as to a meeting of Parliament. The partners from Montreal, however, were the lords in the ascendant. Coming from the midst of luxurious and ostentatious life, they quite eclipsed their compeers from the woods, whose forms and faces had been battered and hardened by hard living and hard service, and whose garments and equipments were all the worse for wear. Indeed, the partners from below considered the whole dignity of the Company as represented in their own persons, and conducted themselves in suitable style. They ascended the

164

rivers in great state like sovereigns making a progress, or rather like Highland chiefs navigating their subject lakes. They were wrapped in rich furs, their huge canoes freighted with every convenience and luxury, and managed by Canadian voyageurs, as obedient as Highland clansmen. They carried up with them cooks and bakers, together with delicacies of every kind, and abundance of choice wines for the banquet which attended their great convocation. Happy were they, too, if they could meet with any distinguished stranger—above all, some titled member of the British nobility—to accompany them on this stately occasion, and grace their high solemnities. Fort William, the scene of this important annual meeting, was a considerable village on the banks of Lake Superior. Here, in an immense wooden building, was the great council-hall, as also the banqueting-chamber, decorated with Indian arms and accoutrements, and the trophies of the fur-trade. The house swarmed at this time with traders and voyageurs from Montreal bound to the interior posts, and some from the interior posts bound to Montreal. The councils were held in great state; for every member felt as if sitting in Parliament, and every retainer and dependant looked up to the assemblage with awe as to the House of Lords. There was a vast deal of solemn deliberation and hard Scottish reasoning, with an occasional swell of pompous declamation. These grave and weighty councils were alternated by huge feasts and revels, like some of the old feasts described in Highland castles. The tables in the great banqueting-room groaned under the weight of game of all kinds—of venison from the woods and fish from the lakes, with hunter's delicacies, such as buffaloes' tongues and beavers' tails, and various luxuries from Montreal, all served up by experienced cooks brought for the purpose. There was no stint of generous wine, for it was a hard-drinking period—a time of loyal toasts and Bacchanalian song and brimming bumpers.

“While the chiefs thus revelled in the hall, and made the rafters resound with bursts of loyalty and old Scottish songs, chanted in voices cracked and sharpened by the Northern blasts, their merriment was echoed and prolonged by a mongrel legion of retainers—Canadian voyageurs, half-breed Indian hunters, and vagabond hangers-on—who feasted sumptuously without, on the crumbs from their table, and made the welkin ring with old French ditties, mingled with Indian yelps and yellings.”

“One or two partners,” it is added, “recently from the interior posts, would occasionally make their appearance in New York in the course of a tour of pleasure or curiosity. On these occasions there was always a degree of magnificence of the purse about them, and a peculiar propensity to expenditure at the goldsmiths' and jewellers' for rings, chains, brooches, necklaces, jewelled watches, and other rich trinkets, partly for their own wear, partly for presents to their female acquaintances—a gorgeous prodigality, such as was often noticed in former times in West Indian planters and Eastern nabobs flush with the spoils of Oriental conquest.”

The Hudson's Bay Company had only confined their operations within the limit of this original grant, and now prosecuted their trade with very great vigour. But the “Nor'-westers” pushed away north and west until they had reached the Rocky Mountains, and even beyond, on to the waters of Peace River. No doubt the Hudson's Bay Company took alarm at these new rivals, but it is more than probable that they

would have been unopposed had not an accident just then occurred which changed the aspect of affairs. Lord Selkirk, an energetic Scottish nobleman, having attempted to establish a colony on Red River (afterwards the nucleus of the Canadian Province of Manitoba), was violently opposed by the North-west Fur Company, who found the plains on which he proposed to settle his colonists useful for buffalo-hunting and preparing the great supplies of "pemmican" (ground dried meat and tallow), which formed the travelling food of their fur parties. This strongly incensed the Earl against the New Company, and to enable him the better to punish them he went home and bought so large a number of Hudson's Bay shares as to obtain a controlling voice in the direction of that corporation. This influence he now exerted against the flourishing and obnoxious North-west Company. Rousing up the "Hudson Bays" from their indolence, a vigorous competition commenced, and continued for some years. Wherever the North-westers established a fort their opponents built another in close proximity. Every method which artifice and fraud could suggest, or even open violence compass, was adopted by them to outwit each other, or to obtain the furs of the Indians. At first friendly, when trade did not intervene, they had no mercy when the interests of their rival Companies were concerned. Forts were taken and burnt, the officers in charge and the servants imprisoned and half starved, and sometimes even obliged by famine to surrender; the furs on the way to the rendezvous were intercepted and appropriated, and the whole trade turned into a furious conflict. The Governor-General of Canada sent out warrants and proclamations in vain; these were equally treated with the most sovereign contempt in a land where "the king's writ runneth not," nor had he any power to control the refractory fur-traders. Things went on in this fashion until they culminated, in 1816, in a battle, in which seventeen men and three officers of the Hudson's Bay Company, including Governor Semple, were killed. This was perhaps the most serious casualty which the rivalry occasioned, but still it did not abate the fighting. Now all parley was at an end, and the password was "war to the knife." Officers and men were absolutely engaged by either Company for little other purpose than fighting; and though ostensibly occupied in the fur-trade, their chief recommendation for the posts they held was their pugnacity. These stories form part of the stock-in-trade of a Hudson's Bay host's repertoire to this day. This could not go on very long; and accordingly, in 1821, both Companies began to see the folly of their proceedings. The trade was ruined. The Indians were demoralised by "fire-water." The prices given for the furs were out of all proportion to their value, and nobody was benefited unless it were a bellicose clerk, or other *employé*, who had distinguished himself in this guerilla kind of commerce. The result was that the two Companies coalesced under certain stipulations, Parliament granting them some additional privileges which it would be out of the province of these chapters to describe.

THE CULMINATION, DECLINE, AND FALL OF THE GREAT FUR TRADERS.

The new organisation retained the name of the Hudson's Bay Company, and under this title it continued to prosper until its trading posts extended right across British America, and even within the limits of the United States, to the very shores of

THE GREAT CAVE, LAKE SUPERIOR.

the Pacific, where, indeed, now its chief establishments are situated. By-and-by, as the Company spread its wings, and crossed the Rocky Mountains into Oregon, where its traders had no real right, they were annoyed by less powerful but more irritating opposition. Every Western backwoodsman "went into" fur-trading on a small scale, and "calculated to do a right smart chance of a trade." But he reckoned without his host, or, rather, his next door neighbour occupying the picketed fort on the prairie. No sooner did Angus McTavish or Dugald McDonald, the Hudson's Bay traders, hear that Ephraim E. Goliath was about to go up the Columbia or Willamette River on a trading expedition, than he would start off ahead with a plenteous supply of goods. Intimately acquainted with the country and the people, the legitimate trader would soon make rapid progress. From their mat or board lodges on the banks the sleepy Indians would crawl down to the water's edge and buy powder, shot, and vermilion to paint their squaws and their own dusky cheeks, and blankets to cover their nakedness, offering the Hudson's Bay trader the usual furs in exchange. Now began the trader's policy. Either he refused any pay at all, or gave them the goods at a ridiculous loss to himself—all the time drumming in their ears that "we are your good friends, not like those miserable Boston men;"* and left amid the plaudits of the Indians to repeat the same game elsewhere. Well he knew that the Indian, having once obtained what he wanted, would not take the trouble to come down to the water's edge when Ephraim E. Goliath's canoe load of "notions" made its appearance; or they would want them at a price which it was out of the power of the small capitalist to agree to. The Hudson's Bay Company could afford to lose on one trip, knowing that they would recoup themselves on the next. The petty trader was, however, ruined, and ceased in future to be an opponent in the field.

In regions where they had the exclusive right of trade, they could invoke the strong arm of the law—in the shape of force; but that, in other regions, was a rather dangerous card to play. In British Columbia, for instance, their exclusive right, licence, or lease to trade expired in 1859, when that country was constituted a British colony. In the settled parts the Company had to stand much competition. But in the Northern districts they had, and have to this day, notwithstanding that it is a province of Canada, virtually the monopoly of the fur-trade, no one, as yet, finding it to their profit to oppose them. They have their forts—such as they are—their organisation, their established routine, and intimate knowledge of the Indians, and can, therefore, beat in open competition any interlopers.

Here they would either attempt the old Oregon trick of underselling the trader, or, what is much easier, and nearly as cheap, show the Indians that it is to their profit to deal with no outside trader. They know every Indian in their "district" by head-mark, and soon hear who has been tempted by the big price of the "fur-traders" to sell a fur last summer, and a black mark is put against his name in their "trading lists." For long, it may be, the offender hears nothing about it. Regularly he pays his visit to the Hudson's Bay fort, laden with furs. Then he is a welcome visitor, and departs

* On the North Pacific coast the Indians call all Americans "Boston men," most of the earlier traders being from Boston. On the other hand, the English are called "King George men," most of the discoveries of Cook and Vancouver being in George III.'s reign.

with the customary present. But one unfortunate winter ill-luck befalls the hapless hunter, and, half starved and shivering, he creeps up to the Hudson's Bay fort to beg credit for a few pounds of powder and shot, a couple of beaver-traps, and a blanket. Then he hears of his old offence, and is not over-politely told "to go to the man he traded that black fox's skin to three years before—he will be sure to give him credit." On the whole, the Indian becomes convinced that, after all, it is better to trade with the Old Hudson's Bay Company. Their forts are always to be found. When he is "hard up," he can get credit; and when too old to hunt, he will not be allowed to starve, if he be known as a former good hunter and faithful customer of the Company.

At other times the Company adopted a course which was not so pleasing to its *employés*, namely, buying up a powerful rival. I know of an instance where, many years ago, this plan had to be adopted. A smart young skipper from Boston came out to the North-west coast in a spanking new brig, laden with every kind of Yankee "notion," and pursued his trade with such spirit that he was ruining the Company completely. With a sorry heart, they bought his ship from him at a high figure, and had no sooner done so than they recollected that they would have to buy him too, otherwise he would have gone back, provided another brig, and adopted the same course again. So, with a very wry face, they bought up the New Englander, and made him a chief trader in the Company at once; and there he is still, for all I know to the contrary, one of the highest dignitaries of the Company, and, what is curious, one of the most intense Britons in its service. I believe he stands *alone* as an American converted to an Englishman—we have not a few instances of the reverse!

For long there were evident signs of decay in the Old Company, and its best friends often wondered how it could have stood so long, with its originally rather crazy constitution continually battling with Parliamentary commissions and inquiries. Again and again it was "sat on" in St. Stephen's, but its friends pulled it through. Then it got into a lawsuit with the United States, about recompense for infringements on the rights secured to them by that treaty; but the Scottish factors were too much even for the Philadelphia lawyers, and the Treasury at Washington had to contribute to the one in Gracechurch Street, London. The old shareholders, with the intuitive shrewdness of old times, saw the troubles ahead, and, in 1868, to the horror of the commercial world, which was shocked—albeit that is not a weakness of Capel Court—at their impropriety, so widely different from the traditions of the Company, were persuaded to sell out for a high figure to a New Company of Proprietors. I was "in the country" at the time, and well remember the consternation excited by this unseemly feat of the venerable Corporation. The Company's shares were quoted on the Stock Exchange, and, worst of all, for the first time for two hundred years, at a discount! The New Company began, like the proverbial broom, to sweep clean. They proposed many improvements, and discussed the question of making a railroad through their territories. They talked of introducing colonists, and of many other things which wiser heads had long before proved to be incompatible with the fur-trade. But with experience came reflection, and then began the Dominion of Canada, which, with that earth-hunger which is peculiar to new and growing countries, cast envious eyes on the Hudson's Bay lands. They even threatened to contest the charter, and have Canada from Maine to the Arctic Ocean. They would have them without paying for them either. They would go to law and win likewise.

Meantime sager men than the "Canadian ministry" intervened, and persuaded the Dominion to pay the Company for their rights, real or supposed, and the Company to part with them. To this they agreed, and sold their birthright for the very substantial mess of pottage represented by £300,000. And so, in the words of the Lord President as he closed the last Scottish Parliament, came "the end of an old, old song." The "Honourable Company

VIEW OF THE "RATTLESNAKE GRADE," PAVILLON MOUNTAIN, BRITISH COLUMBIA:
ALTITUDE NEARLY 4,000 FEET.

of Merchant Adventurers trading unto Hudson's Bay," and elsewhere, from that day ceased to have any of their old privileges, and with the exception of a mile around each of their forts, they ceased to be lords of the soil. As a merchant Company they still exist, but as a proprietary government they will no longer be known: the world is too advanced for monopolies. Nevertheless, the Hudson's Bay Adventurers did good service in their day and generation. They preserved peace among the Indian tribes, when in the rest of America there was continual war between the white man and the red. They no doubt impoverished the Indian in some small degree by tempting him to kill off the fur animals

HUNTING THE PRONGHORNED ANTELOPE WITH GREYHOUNDS ON THE EASTERN SLOPE OF THE ROCKY MOUNTAINS.

more rapidly than Nature increased them. But, on the other hand, the furs were of little use to the Indian after he had clothed himself, and the traders supplied him with articles of infinitely more value to the hunter, which he could by no possibility have obtained for

THE SPRUCE FIR OF NORTH-WEST AMERICA (*Abies Menziesii*).

himself. Moreover, deer, moose, and elk (wapiti) skins were not traded—being too heavy to transport—and therefore the main source of the Indian's food was not affected by the fur-trade. The best proof of this is, that in a district where the Company had long had a trading fort, I bought from the Indians a deer; caught in a pitfall, for one ball and a charge of powder, and another one for a few leaves of tobacco. Again, in districts where deer were

not abundant, salmon were so plentiful that, as at Fort Rupert, the traders manured the fort gardens with them. The Company, owing to their monopoly, had an interest in not clearing a country altogether of fur animals, and, as a matter of fact, they periodically "laid over" certain districts, for so many years, from being hunted. Now, no private traders would have done this. Besides, a private trader, wherever he dares in the face of the law, uses spirits as an article of trade, which the Company voluntarily, after the North-West competition ceased, abandoned as an article of traffic, though they could get twice the amount of furs at half the price by giving rum for them. Moreover, the Company used to give a proportionately higher price for inferior furs, such as muskrats', merely in order to prevent the Indians from being tempted to exterminate the more valuable animals.

When the veteran hunter grew aged—he he "Digger" (p. 173) or "Chippeway," the lowest, or the highest of his race—his old patrons took care of him; and the best answer which can be given to those who have painted the Company's rule in the worst colours is the fact that to this day the Indians, to a man, prefer rather to trade with the Company than any other traders, and that even among the worst tribes an officer in their employ is almost as safe as within the pickets of his fort. Rarely have the Company been at war with the Indians, though one or two of their forts have been taken; but this was invariably in the country of the hostile Indians; and if any of the officers have been killed, it was not owing to a feud with the Company, but merely to some private quarrel or accident; whereas the American Fur Company, immediately outside their borders, have more than once fought with neighbouring Indians. They were, moreover, if the keenest of merchants, the most hospitable of hosts, and the many scientific expeditions which passed through their territories could never have done their work save for the much-abused "Company's" aid. Therefore, we are justified, from these and other facts—which might be quoted, were not "the countries of the world" wider than the Hudson's Bay territories—in asserting that the rule of the great Fur Company was, on the whole, beneficial to North America, as well as to the Indian tribes, and that it did honour to the British name.

Those who remember the old times cannot but feel some regret at the decay of the great corporation; and as the writer of these lines passes their warehouses in Gracechurch Street, he cannot help repeating to-day what he wrote years ago of the Company in a sketch, the chief passages of which are reproduced here, the words of Charles Lamb's lament over the South Sea Company:—"This was once a house of trade, a centre of busy interest. The throng of merchants was here, the quick pulse of gain; and here the forms of business are still kept up, though the soul be long since fled."

CHAPTER VIII.

THE FUR COUNTRIES: THE FUR TRADE AND THE FUR TRADERS.

IN the year 1870 he who writes these lines penned a brief narrative of the rise, decline, and fall of the great Fur Company. As the account is quite forgotten, appearing as it did in an ephemeral magazine, he intended to reproduce some of its passages in this work, but believed that much of it must be long ago obsolete. In Europe there have been wars and revolutions—kings have been put up and kings have been pulled down. In America events move even still more rapidly. He found, however, that of all things the fur-traders, far out of the limits of cultivated lands, stood still. Consulting a famous factor of the dead monopoly, he was assured that the affairs of the fur-traders are, like the laws of the Medes and Persians, unchangeable. One goeth and another cometh, but their business is the same. A fur may be worth more one year, and less the other, but in the end it is the same; it is only a matter of a few shillings. It is trapped in the same way, it is traded after the same fashion, it is sent out of the country and sold in London with the same formalities. When the fur animals cease to exist then will also the fur-traders. Meantime, therefore, what was true some years ago may be true yet, and so without fearing that I mislead my readers, I may perhaps draw upon my notes of 1870 for a description of those main features of the fur-traders, fur-trade, and fur-trappers of the present day.

FUR TRADING.

A typical "fort" of the Hudson's Bay Company was not at best a very lively sort of affair, though sometimes, built on a commanding situation at the bend of some beautiful river, and backed by wave after wave of dark pine forest, it was not unpicturesque in appearance. Fancy a parallelogram of greater or less extent enclosed by a picket twenty-five or thirty feet in height, composed of upright trunks of trees, placed in a trench and fastened along the top by a rail, and you have the enclosure. At each corner was a strong bastion built of squared logs, and pierced for guns which could sweep every side of the fort. Inside this picket was a gallery running right round the enclosure, just high enough for a man's head to be level with the top of the fence. At intervals all along the side of the picket were loopholes for musketry, and over the gateway was another bastion, from which shot could be poured on any party attempting to carry the gate. Altogether, though perfectly incapable of resisting a ten-pounder for a couple of hours, it was strong enough to resist almost any force that the Indians could bring against it. Inside this enclosure were the storehouses, houses of the *employés*, wells, and sometimes a good garden.* All night long a watchman would pass round this gallery crying out at intervals, with a quid of tobacco in his cheek, the hours and state of the weather.

* See the engravings in Milton and Cheadle's "North-West Passage by Land."

This was a precaution in case of fire, and the "calling" was to prevent him from falling asleep for any length of time. Some of the less important and more distant outposts were only rough little log cabins in winter—cabins among the snow—without picket or other enclosure, where a "postmaster" resided to superintend the affairs of the Company. The winter hut figured on the opposite page might well stand for the portrait of such a humble "post." The mode of trading was peculiar. It was an entire system of barter, a "made" or "typical" beaver skin being the standard of trade. This was, in fact, the currency of the country. Thus an Indian arriving at one of the Company's posts, with a bundle of furs which he intends to sell, proceeds, in the first instance, to the trading-room; there the trader separates the furs into lots, and after adding them up delivers to the Indian a number of little pieces of wood, indicating the number of "made beavers" to which his hunt amounts. He is next taken to the store-room, where he finds himself surrounded by bales of blankets, slop coats, guns, scalping-knives, tomahawks (all made in Birmingham), powder-horns, flints, axes, &c. Each article has a recognised value in "made beavers." A slop coat, for instance, may be worth four beavers, for which the Indian delivers up four pieces of wood; for a gun he gives twelve; for a knife two, and so on, until his stock of wooden cash is expended, more especially to the east of the Rocky Mountains. In others, the following is the system in vogue, which I describe in my late friend, Mr. J. Keast Lord's words:—"The standard of value throughout the territories of the Company is the skin of the beaver, by which the price of all other furs is regulated. Any service rendered or labour executed by Indians is paid for in skins, the beaver skin being the unit of computation. To explain this system, let us assume that four beavers are equivalent in value to a silver fox skin, two martens to a beaver, twelve musk-rats to a marten, and so on. For example's sake, let us suppose an Indian wishes to purchase a blanket or a gun from the Hudson's Bay Company. He would have to give, say three silver foxes' or twelve beaver skins, or three hundred and thirty-six musk-rats', or other furs, according to the relative positions of worth in the tariff. The Company generally issue to the Indians such goods as they need up to a certain amount, when the summer supplies arrive at the posts, these advances to be paid for at the conclusion of the hunting season. In hiring Indians east of the Cascade Mountains, whilst occupied in marking the boundary line, our agreement was always to pay them in beaver skins, say two or three per day, in accordance with the duty required; but this agreement did not mean an actual payment in real skins—a matter that to us would have been impossible—but that we were to give the Indians an order on the nearest trading post of the Hudson's Bay Company to supply him with any goods he might select, up to the value of the beaver skins specified."* This was written some years ago, Fort Colville being the particular post which the writer had in his mind's eye, and the spread of civilisation, and consequently of dollars, has slightly altered the system of trading on the Pacific slopes. But essentially the ideas are the same as then. At every post, or at least in every district, there is a tariff established which varies little year by year. The Indian cannot understand the varying price of furs, and, accordingly, the Company takes

* "At Home in the Wilderness," p. 57. This work abounds in interesting particulars regarding life in the fur countries. See also Robinson's "Great Fur Land," pp. 240, 315. One or two (obviously clerical) errors in Mr. Lord's computation have been corrected.

WINTER HUT IN THE SASKATCHEWAN COUNTRY.

the risk of this change, and, unless the fall be of long continuance, gives the same price for the furs as formerly, when it was high, or *vice versâ*. Therefore, as Dr. Rae pointed out to the Select Committee of the House of Commons, the Company loses on some furs, but it compensates itself on others.* The Indian need not, however, attempt to beat down the price. The tariff is unchangeable. If he be not pleased, he is at perfect liberty to go to the next shop; and this, combined with the fact that the Company sells nothing to the Indians which is not of the best quality of its kind, has gone far to gain the confidence of the natives in them over the American traders. At some of the forts the Indian is introduced, while bartering, into a narrow passage, the end of which faces a window, like the window of a railway or theatre ticket-office. Here the "noble savage" conducts his negotiations with the trader. After finishing he is presented with some trifle in addition to the payment for his furs, and makes room for some one else. The passage is crooked, for the simple reason that experience tells the merchant that the Indian is apt, in a heated bargain, to shoot him from behind!

THE FUR TRADERS.

The officers of the Company have been classed as follows:—First, the labourer, who is ready to turn his hand to anything: to become a trapper, fisherman, or rough carpenter, at the shortest notice. He is generally employed in cutting firewood for the consumption of the establishment at which he is stationed, shovelling snow from before the doors, repairing all sorts of damages to all sorts of things; and, during the summer, in transporting furs and goods between his post and the nearest dépôt. He is often called a *voyageur*. Next in rank is the interpreter. He is, for the most part, an intelligent labourer of pretty long standing in the service, who, having picked up a smattering of some Indian language, in addition to his native Gaelic or Canadian-French, is useful in trading with the natives. After the interpreter comes the postmaster, usually a promoted labourer, who, for good behaviour or valuable services, has been put on a footing with the gentlemen of the service, in the same manner that a private soldier in the army is sometimes raised to the rank of a commissioned officer. Next are the apprentice-clerks—raw lads, who come out fresh from school, with their mouths agape at the wonders they behold in Hudson's Bay. They grow more sensible and sedate as they pass through the first five years of their apprenticeship, when they attain the rank of clerks. The clerk, after a number of years of service, becomes a chief trader (or half shareholder), and in a few years more he attains to the highest rank in the service—that of chief factor. All other officers of the Company, such as surgeons and ship-captains, equally pass through these grades, and take relative rank, though, of course, they are not apprentice-clerks at any time. Frequently nowadays this initiatory training is also dispensed with in the case of the ordinary mercantile officers. The average salaries of the clerks vary from £20 to £100, with board, and clothing at a little over cost price; while the emoluments of the higher officers vary according to the dividend. They are almost invariably Scotsmen, while the labourers are Orkney men, French-Canadians, and Norwegians. Indeed, for a long time, no young man in Orkney had much chance of his matrimonial proposals being favourably

* Report of Select Committee on the Hudson's Bay Company (1857), p. 36.

received until he had shown his manhood by having made a voyage to the "Nor'-west." Not so many young men of good family now enter the service as formerly, the prospects of promotion not being so great, and when promotion does come the profits are less than they used to be. The labourers are paid miserably—only about £1 or 30s. per month—but still the Company have no great difficulty in obtaining their complement of men.

Winter is dull enough in these snow-choked forts. The furs have to be sorted, looked to continually, and packed. Then the officer occupies his leisure time in reading what books he has, telling interminable stories, sleeping, hunting, or in preparing specimens of natural history, in the study of which not a few have attained eminence. I have heard of a fort where the inmates were so hard pressed by *ennui* that, as my informant told me, "they absolutely began to write commentaries on the Gospel of Ezekiel!" As the spring advances the officer repairs the fort, and gets the furs out to a rendezvous, where the functionary in charge of the "brigade" meets him and others, and delivers over his stores. The rivers are the chief highways in these roadless lands. Often there is immense trouble before the furs can be brought to the coast. The rivers may be so shallow that they have in places to be deepened for the passage of the canoes, and sometimes the winter snow overtakes the convoy and his bales before he can reach the rendezvous. Cases have been known, not only in which the horses had to be killed, but in which even the hair had to be singed off the furs, to broil the skin for food. The furs are now taken down to Victoria or Montreal, sprinkled with rum, packed in old rum casks, or in moth-tight rooms, and despatched by quick-sailing double-manned ships to England. To the annual sales come the fur-dealers from every part—Russians, Bulgarians, Poles, Greeks, Jews, and Gentiles of all nations. Gracechurch Street, London, is then a study for the ethnologist. The dividend is declared by the "Governor, Deputy-Governor, and Committee," who preside over the shareholders in London; and the programme for the following year settled on. And so the routine of the great Fur Company proceeds.

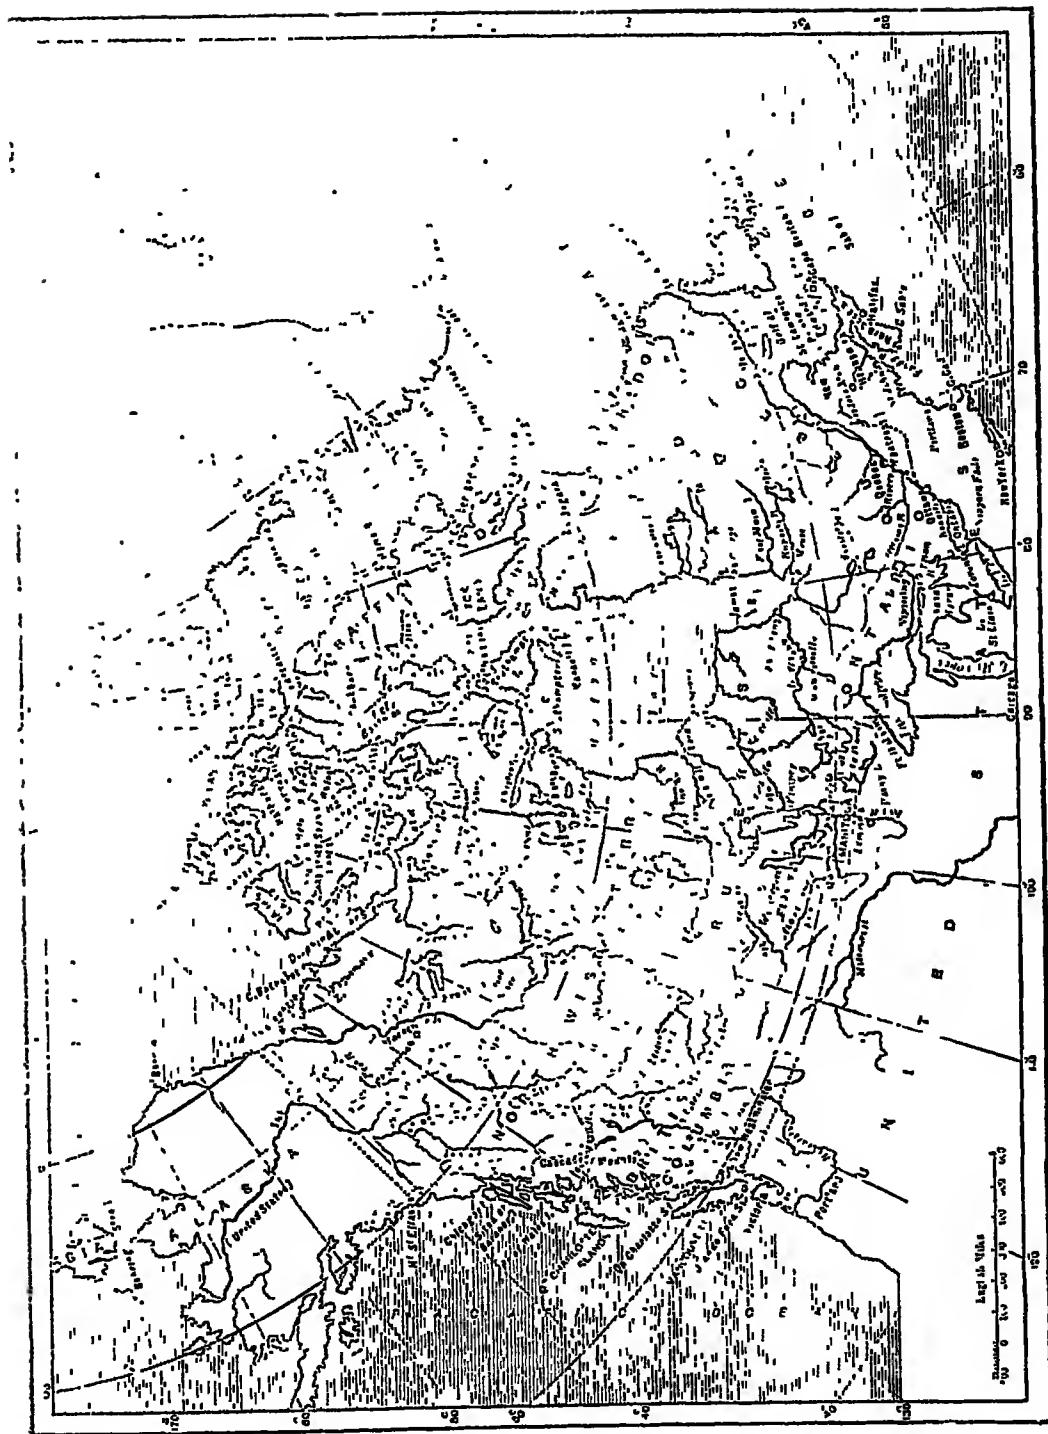

Living far in the outer world, these exiles derived their notions of the ways of the rest of mankind, either from books—often of rather an ancient date—from a raw, newly-arrived clerk, to whom Kirkwall or Inverness was a city, from a rare visit to a frontier town, or from some semi-civilised traveller, naturalist, or sportsman, who might find his way, after long journeyings, to the traders' bepicketed fort. Sometimes a hoary old factor would go to Montreal, or even to London and Paris, and come back with a wondrous display of nicknacks, peculiar photographs, and the undisputed privilege to talk like Sir Oracle, and to shoot with the long-bow for the remainder of his natural life. They conduct—or did conduct—their business much as business was carried on in Charles II.'s reign; and they talked of the world as it was when they left it raw lads, perhaps forty or more years before. Duelling was still supposed to be the "correct thing among gentlemen," and it was thought quite indispensable to a "gentleman's honour to call out another gentleman," with whom the challenger had lived on terms of friendship for many years, and must, perforce, should the bullet not do its wicked work, therefore live in enmity a good many more yet. Many of the Company's officers are, however, polite and even polished gentlemen. One I knew who was a good classical scholar, and more familiar with Tasso,

Dante, and Alfieri than any one whom I have met since that date. With their wild surroundings these people soon became half courtier, half savage; the polite side of their existence only to be uncovered when—rare event—a stranger came amongst them. Some of the officers were men of "good family," and proud of their gentle blood and long descent; and all the more so that they were Scotsmen, and had a forty-linked consinship among Highland lairds and caterans. Not less proud were they of their connection with the Company. They never looked upon themselves in the light of mere clerks of a

FUR ANIMALS: THE WOLVERINE, OR GLETON. (*Gulo luscus*.)

commercial corporation, but talked most contemptuously of "quill-drivers" and "counter-jumpers" generally. No Government clerk was prouder of his appointment, no young East Indian "writer" in the palmy days of John Company more exultant over his, than were the young clerks in the great Fur Company's employ. And with reason too; for many of them, within a year or two of their entrance on duty, were governing a district as large as Scotland, thinly peopled, no doubt, but with unchecked and almost irresponsible power over the destiny of the few hundred savages who trapped furs for his masters. Then from being merely in receipt of a salary, they rose to be "traders" and "factors." When they were "partners" in the Company, they shared in its profits, and had in their turn the making and unmaking of factors and chief factors; the headship of a department was hardly beyond their reach, and they might even attain the summit of all human greatness, and become "Governor-General of Rupert's Land."

MAP OF BRITISH NORTH AMERICA.

When the young clerk went out to "the country," a wife as a *compagnon de voyage* was out of the question; and most frequently, when he was able to marry, like the other pioneers of our dependencies, he was far distant from the women of his own race, or from civilisation of any sort. Accordingly, it was common among the servants of the great Fur Companies to take a daughter of the land to wife, not only because few white women cared to take up their lot with the rovers of the wide fur countries, but that it was also a matter of policy to ingratiate themselves with the powerful Indian tribes among whom they were thrown. So sons and daughters were born to the Macs and Pierres, and the blood of Indian warriors mingled with that of "Heiland lairds" and French bourgeois, the traders, the trappers, and the *voyageurs* of the great Fur Company. Between the husbands and wives there could, of course, be little sympathy. The uncivilised wife clung to her customs and her people, while the husband treated her not as an equal but an inferior. However, in course of time, as a fort grew older, there arose up around it a number of half-breed girls tolerably well educated, not unintelligent, and no way deficient in beauty. Add to this a handsome figure, and that peculiar sweetness and *naïveté* peculiar to their kindred, and it is not to be wondered at that she should soon charm the young officer out of the recollection of the fair-haired Scottish lasses he had left in the Glen of Tramowhusky. Moreover, when it is considered (and you may be sure Donald M'Donald, the "pushing" young clerk, was not at all deficient in reflection that way) that these young ladies were often the daughters of the great factors and other officers of the Company, the wedding of them can scarcely be called an act of great self-denial. The old factor would not be apt to forget his son-in-law when the next batch of chief traders was to be made, and, moreover, dying often possessed of an abundance of filthy lucre, would render his daughter's husband independent of the Company. It used to be a tradition that to marry a "white" woman and be an Englishman meant ruin to a youthful *employé* of the great fur-traders.

Most of these savage-mated men educated their children tolerably well, and though the Indian clings to them keenly, yet very often they turn out very well. Those who have taken unto them "some savage woman" do not often return with their aboriginal spouse and her dusky brood to Britain, but remain in the country. In British Columbia, Manitoba (Red River Territory), the Valley of the Willamette, in Oregon, and other localities, many of the Company's officers and servants have settled down as farmers. Indeed, there are certain districts in these provinces and states where the population is all of that type. Whether their descendants will be for good or evil to the West is a problem, though many will not hesitate to decide that it will be for evil. I cannot bring myself to so sweeping a conclusion, for as yet the experiment has not got a fair trial. Education and association with a superior race will do much for the next generation. Vacillation and want of strength of mind seem the weak points in the half-breeds' characters. The girls are sometimes no better than they should be, and the boys often drunken and disreputable, frequently combining in their person the bad qualities of both races. However, some have been in the local legislatures, and others have held commissions in the army, although, perhaps, neither office will afford a striking proof of their morality. Among my acquaintances are embraced one or two tolerably honest lawyers and several doctors—not more deadly than ordinary, but whose dusky countenances

tell that if they traced their ancestry back to their grandfathers it would assuredly land them in a wigwam.

The discipline maintained in the forts and travelling-parties of the Company, though free and easy, was yet within certain limits severe, and was rarely rebelled against. It was often a wonder to me how a party of grey-haired *esquimaux* would obey a mere boy, against whom they could have rebelled with impunity. The reason of this was probably owing to the docile character of the French-Canadian and Orkney men, and to the traditional *esprit de corps* of the Company. I only know of one instance of downright rebellion, and that was in a very remote fort on the Stekin River, in Alaska. Incensed beyond all endurance at the drunken madness of the officer in charge—a half-breed—one of the men, a French-Canadian, shot the latter. Few offences of a serious nature are, however, ever committed in the fur countries—at all events, we hear little about them. They were either condoned, or summarily punished by the Company, without coming before any court. If an Indian murdered one of the Company's servants, he was pursued, captured, and hanged; if not at the moment, at another time, though it might be years afterwards. The French-Canadian, puzzled by the endless "Maes," usually designated his officers by nicknames. Thus, he knew *M'sieur Mackenzie le rouge*, *M. Mackenzie le blanc*, *M. Mackenzie le borgne*, *M. Mackenzie le picoté*, *M. McDonald le grand*, *M. McDonald le prêtre*, *M. McDonald le bras-croché*, and so on, according to some distinguishing mark or personal peculiarity. He was hard worked, and poorly paid, but yet thoroughly believed in *la Compagnie*, and looked upon it in the light of little better than treason if you ventured to doubt whether "the Company" was an independent power, of which Great Britain was only a powerful ally, and America the natural enemy! A marked distinction was kept up between "men" and "gentlemen" in all records of the Company. All above and including the rank of clerk were *gentlemen*, all beneath were only *men*.

THE FOOD OF THE FUR COUNTRIES.

The gentlemen in the forts all dined together; if it were a large fort, in the "hall," but from this meal their wives were excluded. The fare on these occasions was, in the interior forts, often poor enough, and had a tendency to run upon one particular article. At one season it was all wapiti, at another all beaver, and at a third buffalo. If beaver were in—it was beaver boiled, beaver smoked, beaver roasted, and beaver-tail. If salmon were running in the river, the fort table had salmon until we wished for a salt herring. At some of the forts on the borders of the great prairies east of the Rocky Mountains the delicate prong-horned antelope (Plate VI.) appeared occasionally in the bill of fare. Sometimes there were mighty hunters in the fort. Then it was that the grizzly was shot, or in the dull winter days the roaming brown bear would be rooted out of its hybernation, valiantly slain, and borne back to the fort in triumph, the resinous pine torch lighting the hunters and the porters through the gloomy forest at the waning of the day. Such a scene is portrayed in our cut on p. 181. At some of the far Northern interior forts, where the furs were only taken once in every two years, and the "outfit" once in the same interval, the officers' supply had to be limited enough. At Fort ——— there prevailed a tradition that the "outfit" for the personal needs of the unfortunate wight in

charge used to be ten pounds of powder, fifty pounds of lead, and a pound of fishing-tackle. But New Caledonia (or what is now the northern portion of British Columbia) was the *l'île noir* of unfortunate clerks, and to that region were banished all who had offended the powers that were at Fort Victoria or Vancouver. At the great depôts on the coast the chief officers dined in sumptuous style, with no lack of old Hudson's Bay port, kept many years in the Company's cellars in London before it made the sea voyage to the North Pacific, while in others the dietie necessities were so incapable of being varied that to keep up table discipline the officers fed on red salmon and the men on white—the one, in other words, on good fish, the other on bad; though both were equally cheap to the Company. In fact, it was a favourite fashion with the old factors at Victoria—when descending on the vices and extravagances of the new comers whom the gold mines had attracted to “the country,” compared with their model men, the “old settlers,” and the Hudson's Bay *royageurs*—to remark, with a countenance expressing a fear of the decay of the constitution, “that common working-men absolutely eat *red* salmon!”

When travelling, “pemmican,” or tallow mixed with pounded dry buffalo meat, and run into skin sacks—and now so familiar to all readers of Arctic voyages—was the favourite food, bread was often never tasted for years; and though, in times of scarcity, they were often hard pressed, yet, when provisions were abundant, the men were well fed, and indeed were merry considering their hard work. In addition to a suit of clothes, generally consisting of a blue cloth “capot” (or one made out of a blanket), leather trousers, made after the Indian fashion by his wife, a striped cotton shirt, and a fur cap, with a game belt of variegated worsted, or even netted silk, and often a gorgeous “fire bag” for holding pipe, tobacco, &c., and a carrot of tobacco *per annum*, the Company used to allow each man *per diem* eight pounds of solid meat of buffalo, venison, horse, &c., and ten pounds if there was bone in it. In the autumn months, in lieu of meat, each man would receive two large geese, a few ducks, and fish was supplied in like proportion. Sometimes in wet weather, or in making long “portage,” there would be served out a glass of rum; but though both officers and men were rather addicted to a carouse when they could compass it, yet generally they had perforce to be very temperate. I have before me a note of the daily consumption of dried buffalo meat at Fort Edmonton, in the buffalo country on the Saskatchewan Plain. At the date of the statement (February 2, 1858), there were living at that post twenty-seven men, nineteen women, and forty-eight children, in all ninety-four persons; and to this family the officer in charge daily distributed no less than 406 lbs. of meat! However, to prevent astonishment at this enormous butcher's bill, it ought to be mentioned that this was their exclusive food—no bread, potatoes, or other vegetables being, in general, eaten with it. At New Year each family received a little rum, a few pounds of flour and “grease,” and a beaver, or piece of elk, &c., which was called the “*régale*.” On New Year's morning they called upon the officer in charge of the fort to wish him the compliments of the season, when they were treated to sweet cakes and a glass of rum. The day wound up with a ball, and I have particularly observed, in the journal which is kept in each fort, that on January 2nd there is this suggestive entry: “*No prayers this morning.*” If you listened to the men, there was no evil which *la Compagnie* was not guilty of conniving at, and their wrongs were endless. They would tell you, for instance, how, when a man's

DIGGER INDIANS OF THE SIERRA NEVADA MOUNTAINS.

engagement was up, he could never get out of the Company; he was either in debt, or his accounts were scattered all over the country. Generally, however, when you began to inquire into these wrongs, it would be found that most of them were groundless or exaggerated. Still, the Company after their own fashion exacted a very fair return for their money.

THE PROFITS OF THE FUR TRADE.

About the *profits* of the Company there has been grave misapprehension. Certainly at first these were enormous. In the hostilities between the French and English from 1682 and 1688 they lost £118,014, yet in 1684 a dividend of fifty per cent. was declared, and in 1689 one of twenty-five per cent. The capture of fortresses by the French at intervals between 1682 and 1697 cost them £97,500. Yet, shortly after the peace of Utrecht, they had trebled their capital with a call of only ten per cent. on the shareholders. No wonder that in those days, and for long after, a Hudson Bay share was never in the market. An old gentleman (one of the most celebrated, historically, of all the heroes of fur-trade, now deceased) told me that, when he established Fort Dunvegan, on Peace River, near the Rocky Mountains, the regular price of a trade musket was Rocky Mountain sables piled up on each side of it until they were level with the muzzle. The sables were worth in England at least £3 apiece, and the musket cost in all not over £1. The price of a six-shilling blanket was, in like manner, thirteen beavers of the best qualities and twenty of a less excellent description. At that time beaver was worth 32s. per lb., and a good beaver would weigh from 1 lb. to 1½ lb. Gradually the Indians began to know better the price of a musket and of their furs, and to object most decidedly to the one being piled along the sides of the other, which report sayeth was lengthened every year by two inches, until the barrel reached colossal dimensions. Finally, a pestilent fellow discovered silk as a substitute for the napping of beaver hats, and from that dates the decline of the Hudson's Bay Company. The Company held by their beaver skins until they saw it was hopeless. This fur has never since rallied in price. So rapid was the fall that, while in 1839 beaver was 27s. 6d. per lb., in 1846 it had fallen to 3s. 5d. As beaver was the staple of the fur-trade the profits rapidly decreased. At the present moment beaver is obtained from the Indians at Victoria, Vancouver Island (where there are numbers of fur-traders besides the Hudson's Bay Company), for 7s. per lb., and is worth in London about 10s. or 12s. Just now the dividends of the Company are very moderate. But, of course, there is the value of their forts and "plant," the land round these forts, which may eventually (as did that on which the town of Victoria is now built) rise immensely in value, and their sailing vessels and steamers, besides the various sums which they have received as indemnity from the United States and the Canadian Governments, and as the price of the town site of Victoria and other places built upon their land.

I may add that I lately read in a publication which, if not authoritative, ought, from its enormous circulation to be so, that £20,000,000 have been extracted from the profits on the furs bought from the Indians, and that notwithstanding the Company have done nothing for the amelioration of the aborigines, and have in their territories neither church nor school. The first statement may be perfectly correct; the second can only be characterised as untrue.

CHAPTER IX.

THE FUR COUNTRIES: THE HUNTERS AND THE HUNTING GROUNDS.

WHEN the writer of these pages first landed in North-West America—few as are the years that have elapsed since then—it was a very different country from what it is now. The old romance of the far West had not died out of it, prosaic civilisation had as yet little affected the greater portion of it, and even the new life had, what is now fast disappearing, a picturesque aspect of its own, due to the sudden overturning of the dreamy past. It was then, as it is still, a region of dense forests, snowy peaks, and rapid rivers—a land interesting both to the geographer and naturalist, as well as to the mere lover of wild adventure and the hairbreadth escapes common to the stirring life of the fur-trader.

Was not this the region where that most redoubtable of travellers—Captain Lemuel Gulliver, of London, whilom of Lilliput and Laputa—located the wondrous land of Brobdingnag, and where the old Greek pilot, Juan de Fuca, was sent to fortify the strait which now bears his name, in case the English should pass through it from the Atlantic to the Pacific? It was the land where Cook won some of his laurels, and where George Vancouver grew famous. It was the scene of Lewis and Clarke's famous adventures; and is better known to the general reader as the country which Washington Irving encircled with a romantic interest by his "Astoria" and "The Adventures of Captain Bonneville." To botanists it had a wider and even more enduring interest, for here lay the scene of the researches of Archibald Menzies, David Douglas, Jeffrey, Burke, Geyer, and many others, the fruit of whose labours blooms in our gardens and pineta; while the wild tale of their wanderings forms a fit subject for the story that circles round a western camp-fire when the days grow short and the nights are dark and dreary. It is a wide region of gloomy pine forests and green sunny prairies; of dismal sage brush plains and of rugged mountain ranges; of rivers up which the salmon ascend in countless numbers; and of quiet placid lakes, from the banks of which the deer look down on the passing *royageur*, startled by the unaccustomed sight of a human being. It is here where the gold-miner sifts the glittering sands, where the peltry trader holds sway, and where the Indian roams in all his pristine freedom. Or, go down into the warm Californian valleys, or on to the green prairies of the Willamette and the Sacramento, and you may see the oak trees and the sunny terraces darkening with luscious grapes, fruits, and flowers, or league after league yellow with a harvest which helps to feed Europe. It is a land of many climates, of many Indian tribes and races, and the home of a generous manly race, who are fast filling up all the solitary places of the great region they have invaded. Such, at a glance, is North-West America. To me the North-West has even a deeper and a more human interest, for I visited it at a time the like of which can never come back again. For years I wandered over many of the wildest and least known parts of the country, and was fortunate enough to be the companion of many of those who have helped to make its history—shaping their "old course in a country new"—and to mingle in many of its wildest and most stirring

enterprises. "All of this I saw, and part of it I was." During the years I spent in the region sketched out I was every now and again coming upon some links which connected us with the past, just as in the depths of some quiet forest we come upon the remnants of a long past and forgotten race. In Resolution Cove, in Nootka Sound, where Cook records that he laid his vessel up for repair, I disinterred the bricks of the armourer's forge, vitrified and fresh as if it had been built but yesterday. The lordly Spanish Dons who once held Nootka had left their traces in cannon balls and Mexican dollars, which are still occasionally dug up on the site of the old fort. The Indians still remembered, by tradition, the story of their surrendering Nootka to Vancouver; and no historian could have told it in quainter words:—"The men began to cultivate the ground, and erect a fort and stockade, when one day a ship came with papers for the head man, who was observed to cry, and all the white men became sad. The next day they began moving their goods to the vessel."* The Spanish features were not uncommon; and Indians lived there who could count ten in Spanish, and repeat many traditional words of that language. The grandson of old Moquilla, whose name occupies so prominent a place in the records of those stirring times, still ruled Nootka Sound, when, with a solitary companion, I paid it a visit for the first time after he had murdered the crew of a trader six months before. The visit I am likely to remember for some years to come; for then was it that I had the dismal satisfaction of hearing a lively discussion on the (to me) rather interesting question of whether it would not be better, for state policy, to cut off our heads, on the principle that headless men tell no tales. That the "ayes" were in the minority in Moquilla's council this record is the proof. Vancouver's name they pronounced quite distinctly; and I still found in Puget Sound a last connecting link between his day and oars in the person of old Seattle, chief of the tribe which occupied the site of the modern town of that name. What thoughts must have been running through the mind of that old man as he glanced over the wonderful story of the seventy years which had come and gone since George Vancouver's stately ships sailed up Puget Sound I know not, for the leathern countenances of these Indians, like dead men's faces, tell no tales. At all events, all that he seemed to remember of the great sailor (and that he related with extreme gusto) was how the pig-tailed boatswain's mates used to give three dozen to the men of a morning; and the reminiscence was quite in keeping with the martinet character of the man! The medals that Lewis and Clarke distributed among the Indians at the mouth of the Columbia could still be sometimes seen in the Chinook lodges, though that tribe had long disappeared, with nearly all the Columbia and Willamette tribes, from their old homes. Old "*Astoria voyageurs*" I sometimes still come across, though on the site of the old fort a smart Yankee village had sprung up, and it was looked upon as quite an antiquarian feat to point out the site of old Fort George which the irate British officer—who had pressed all sail after the last war broke out with America, expecting to surprise a rich arsenal—declared most irreverently he could blow to pieces in a quarter of an hour with a 10-pounder. The son of Pierre Dorion, whose escape with his heroic mother, after the murder of his father, is so graphically portrayed by Irving, was my companion for weeks together before I.

* See "*Sproat: Scenes and Studies of Savage Life*," p. 26.

knew how historically interesting was my *compagnon de voyage*; and the grandson of the one-eyed Concomoly, chief of the Chinooks, the marriage of whose daughter to the factor of Astor is so amusingly related, trudged side by side with me for many a summer's day. Captain Bonneville was not to me, as he is to many, merely an abstraction, invented by the novelist on which to hang many a quaint old tale of love and war, but a hearty, genial old veteran, who fought his battles anew, when he got so ready a listener as

IN THE ROCKY MOUNTAINS.

was the writer of these recollections.* Of all the old botanical explorers I saw or heard more or less. I gathered cones from the very trees which Douglas himself did, and his initials, rudely cut, could yet be deciphered on the bark of a pine-tree. Tolmie, to whose researches Hooker was so indebted when publishing his "*Flora Boreali-Americana*," was yet living in the country, a hale chief factor in the great Fur Company; but, if the truth must be told, rather more interested in a pelt than in a plant. A lonely grave, however, marked the last resting-place of Gairdner; and the *Dalles de mort* of the Columbia was the death-place of more than one scientific explorer.

* See the author's "Sketches of Men and Manners on the Pacific Slopes of the Rocky Mountains," in Dickens's *All the Year Round*, 1868, *et seq.*; and Robinson's "Great Fur Land," pp. 27, 136.

I saw Nature in her wildest condition, and yet saw also enough to show that she will not long remain thus. Already the Pacific railroads are changing the whole aspect of the region through which they run. The forests will be no longer wide, unbroken seas of trees; the lumberman and the railway contractor will soon humble their majesty. When the prairies become "real estate," and the river cascades only "water privileges," then the noble forests of North-West America will be only so much lumber—"middlin' good" for "sluice boxes" and "clapboard shanties," but no great things at that either. A race innocent of sentiment as of science, and ignorant of the grand old past, are filling the places that a few years ago knew them not; and though they may bring many of the advantages of civilisation, yet with them will depart much that was fair and of good report in the pleasant past.

We propose, therefore, while it is possible, to present in these chapters some brief sketches of the countries on the western slopes of the Rocky Mountains, mingling with them and diversifying the more scientific matters by some glimpses of the wild life and denizens of these regions. We may also be pardoned if, while passing through these great forests and prairies, we speak of the men who pursue their callings in that vast lone land—the simple-minded, lightsome-hearted canoe-man, strong in his belief in *la compagnie* as an independent power; the "honest miner," who shouts to us as we pass his claim on the creek down in the valley; the stalwart backwoodsman, whose axe rings on the hill-side, and who hails us as a brother—only of a more theoretical sort—as we pass his logging camp; the sinewy, leather-shirted "mountain boy," whose trust is not in princes or in presidents, but in his beaver and marten traps, whose geography is limited to the circuit of his own travel, and whom you can incense in no worse way than by venturing to cast a reflection on the "plugging" power of the "five foot o' holler iron" he carries over his shoulder; or the swarthy Indian who steers our canoe down some unexplored river, and whose race is disappearing before the flood of civilisation "like ghosts before the cock-crow." While we can, therefore, let us snatch from oblivion some little fragments of what North-West America was when we knew it in the glad some years that will never more return. "The earth hath bubbles as the water hath;" surely these are not "of them."

THE FREE TRAPPER.

The fur-trade bred up a class of men the like of which the world never saw before and will never see again. The progress of the settlements and the failure of the peculiar calling by which they made their profit have led to their decay, and will soon lead to their entire extermination. In future years they may be included among the creatures of romance, unless those who know them more intimately than in books narrate their experiences of them and rescue some of their characteristics from oblivion. They were a product of the fur countries of North America quite as much as the bear, the beaver, or the marten, and infinitely more interesting. The countries which only thirty or forty years ago, or even less, were the scene of their adventures are now thickly populated. Where they pitched their camps are busy towns, and on the scenes of their bloody fights with the savage Indians, children play unconsciously of the mouldering remains of the "great victory" which their father's plough ever and anon brings to the surface.

it if met alone in the woods or other solitary place. The Indian would be "avenged" in like manner by his friends; and so the endless vendettas of the West originated and still go on.

FOR ANIMALS: BRINGING HOME THE BEAR (p. 171)

It may be asked, What could tempt men to follow such a business? There was a charm in the thorough freedom and independence of the life, which attracted free spirits to it. Few of the adventurers, I believe, ever seriously intended to follow the profession for life when they first wandered "way West." They probably purposed making a little money

and then settling down to a quiet existence, tilling the soil. But in nine cases out of ten that time never came. Either they never could scrape enough together, or children grew up around them, and united them with strong bonds to their savage mode of life. Most of them lived and died trappers. I have known a few of them who had gone back to the "settlements," but soon returned to their wild life, disgusted with the dull conventionalities of agricultural society. The ways of civilised life and cities were ridiculous in their eyes, and they were "half pizened with the bread, the bacon, the sarse, and the mush" of a Western farmhouse. Yet a notion prevails that trappers were long-lived; so they were when they had a fair chance, but the Indians cut it short. Some of the trappers whom I knew are old men; and it has been my lot to know, more or less, such celebrated men as Kit Carson, Jim Bridger, Jim Baker, and others. They were almost universally Americans; and though they were not inimical to the female Indian, yet they invariably entertained an implacable feud against some particular tribe. They had, also, their favourites, against whom it was rank sedition to say a single word. "Crows kin be trusted," an old fellow would remark in camp, his cheek filled with tobacco; "Snakes ain't no such 'count; but if ye want to get the meanest pizen-bad lot of Injuns, just trap a fall down to the Washoe country, just!" And immediately afterwards you would hear some other man give exactly an opposite opinion. On closer observation you would generally find that the lauded tribe was the one he had lived longest among, to which his squaw belonged, or which was the easiest to strike a bargain with; for, generally speaking, they were a most unreasonable set of men in everything connected with aboriginal affairs.

TYPES OF THE "MOUNTAIN MEN."

Some of old Baker's opinions I have narrated in another work, and need not repeat here. He is, I believe, still living. I have heard of him, since my return, from a traveller who saw him looking very much at home on the platform of a "depôt" on the Pacific Railway, which must have been a strange sight to him. But of the many good stories told of him, about the last I heard—and the very last I fear I shall ever hear—was from General Marey. He had then established himself on a trading post or store at the crossing of Green River, where he did a pretty lively trade with the Indians and emigrants, who in those days went in great numbers with their wagons and cattle across the plains to Oregon and California. He was prospering until he was opposed by a Frenchman, who of course stirred within Jim the most bitter animosity, until it culminated in a cessation of all social intercourse between them; in fact, the Celt and the Saxon "cut each other," though probably there was not another white man within a couple of hundred miles. At the time of General Marey's arrival this professional enmity had reached such a point that he found Baker standing in the doorway with a loaded and cocked pistol in each hand, "pretty drunk and intensely excited. I dismounted and asked him the cause of this disturbance. He replied, 'That thar' yaller-bellied toad-eatin' parley-voe over thar and me, we've been havin' a small chance of a skrimmage to-day, we have, Cap.' I remonstrated with him on his folly, but he continued: 'The sneakin' polecat! I'll raise his har yet; I'll skulp him, Cap, ef he don't quit these

years' diggings.' It appeared that they had an altercation in the morning, which ended in a challenge, when they ran to their respective cabins, seized their revolvers, and, from their doors, only about one hundred yards apart, fired at each other. They had returned to their cabins, taken a drink of whisky, re-loaded their pistols, and renewed the combat. This peculiar duel had been maintained for several hours when I arrived, but fortunately for them the whisky had produced such an effect on their nerves that their aim was very unsteady, and none of their many shots had taken effect." The General, being an old friend of Jim's, took away his pistols, and administered a severe lecture to him. He acknowledged that when the whisky was in him he had "nary sense."

Perhaps the most celebrated of all the Rocky Mountain trappers was Kit Carson, to whose exertions Fremont was deeply indebted when caught in the winter snows, though the old man used to complain that the "path finder" was rather stinted in the acknowledgment of his services. Born in Kentucky, he came at an early age to this wild region, and his name was soon known among the records of border warfare and dauntless deeds. His narratives were full of interest, and withal related with great modesty, a characteristic by no means common to all these mountain cocks. His famous ride of seven hundred miles from Santa Fé in New Mexico to Independence in Missouri, carrying despatches regarding the outbreak of the Indian war in the former country, though one of the best known, is by no means the most extraordinary of his feats. The distance was accomplished by means of relays of horses in seven days from the date of his starting. When he arrived at his destination the saddle was found stained with blood, and the rider was so exhausted that he had to be lifted off his horse. Notwithstanding the great reputation of the man for courage and hardihood, the reader may be surprised to learn that Carson was by no means formidable in strength; on the contrary, he was a little man, about five feet four inches in height, stout, and rather heavily built, but with a frame alert and active. He was very quiet in his manner, and spoke in a soft low voice, common to those who have passed an exciting life. Towards the close of his career Carson became "colonel" of irregular cavalry in New Mexico. He died in 1868. His deeds are recorded in many books and boys' tales of adventures, with various exaggerations, though the life of the man required no such embellishments.

One scarcely less famous was old "Peg-leg Smith," so called to distinguish him from the numerous Smiths of the West, on account of a wooden leg which he had worn since anybody remembered him. Old Peg-leg's day was over before mine. All that I remember of him was as a garrulous old fellow in San Francisco, no way backward to "take a drink" when he found any one willing to invite him. His adventures and eccentricities formed the subject of a book published some years ago; and, if my memory does not deceive me, an article about him appeared in one of the English magazines about the same period. On one occasion old Peg-leg came down to a frontier trading post, and there in a few weeks not only spent all the earnings of the past season, but had also run so far in debt that his fine white horse, which had been his companion for years, was placed in pawn in the trader's stable. It was in vain that Smith begged for its release. Pleading being in vain, Peg-leg tried to get possession of the stable key, but that attempt also proved futile, until at last, all pacific methods failing, he

resorted as a last expedient to force. Waiting until the trader was asleep, he hopped to the stable-door, applied his loaded rifle to the key-hole, and in a crack blew the lock off. In another minute the trader, aroused by the noise, was on the ground; but only just in time to see his debtor careering joyously on the back of the white horse over the prairie, waving his cap, and galloping at such a rate as to put pursuit out of the question.

A remarkable man, but one much less known, was Albert Pfeiffer. Like Carson, he was in the irregular Mexican cavalry; indeed, he was lieutenant-colonel of the same regiment. He was a man of a very singular appearance. His red beard grew in patches, the intervening space appearing burnt and discoloured. This was owing to his having been poisoned by some of the Indians' arrow-poisons years before. He wore blue goggles to shield his weak eyes; yet, though they were weak, they were bright, clear, and quick. His face was almost ghastly in its signs of suffering, and he walked stiffly with a cane, being scarred with nearly twenty wounds, carrying in his body some Indian souvenirs of bullets, and bearing two frightful marks where an arrow had pierced directly through his body, just below the heart. A native of Friesland, he came to the United States some thirty years ago, and during all that time served as an Indian pacificator, fighter, and trapper, or as a guide to passes in the mountains known only to himself and the Indians. An acquaintance of mine used to relate an anecdote of Pfeiffer. They had started on a tour together, and as they rode along, "the colonel" gave him various directions how to behave in case they were attacked by Indians; finishing by saying, in his slightly broken English, "And now don't *forget*, if me be wounded, you kill me *at once*, for I will not fall alive into dere infernal hands: dey *torture* one horribly. And if you be wounded, *I kill you, you see*. Don't fail!"

Another specimen of the mountain man was an old fellow whom I may call Seth Baillie. (That was not his name, but it will do as well as any other.) Seth was rather an intelligent man; and during our rambles I used to be greatly entertained by listening to his opinions on men and things, on all of which he pronounced with the utmost confidence, though his education (as far as book learning was concerned) was limited, and his range of observation equally so. Still, like all Western folk, he looked upon himself as "powerful smart," and a "right smart chance" of an "argifier."

In one of the rougher settlements of the Willamette, in Oregon, I had been asked to stand umpire in the following case:—One day an old settler's boy had come home from the backwoods district school, and told his parents that the sun was many millions of miles away from the earth. The father was a school guardian, and was horror-struck at what he styled, "sich infidel talk;" so the poor schoolmaster was admonished. "Who was ever thar' to measure it, I'd like to know!" the old farmer remarked to me when telling of the atrocious "infidel talk" of the quondam schoolmaster. Thinking the story would amuse Baillie, I told it to him, without, however, venturing an opinion on the merits of the case. Mr. Baillie remarked, "He rayther thought the old 'coon's head was level on that yer question." He proceeded to give his reasons for the faith that was in him. "I once heern talk like that afore, down to the settlements. One fall I was down thar' to do tradin', and when settin' in the store thar' I heern a kind uv half schoolmaster talkin' like that. Sez I to him, 'Mister, do you say the 'arth is round?' 'Wal,' sez he, kind o' laughin' like, 'men uv science say so.' 'Men uv science,' sez I,

'be darned.' I know a sight better. Did you ever come across the plains?*' 'No,' sez the schoolmaster. 'Then,' sez I, 'you don't know nothin' about it; for I com'd across the plains and see'd so far fernenst me, you couldn't see no further. Neow, ef the 'arth war round, heow would that have bin? Neow, once afore I heern a darned fool like

THE WHITE-HEADED EAGLE OF NORTH AMERICA. (*Haliaeetus leucocyphus*.)

you' (sez I to the schoolmaster, and the boys in the store larfed like mad) 'talk like that, and I didn't say much, but went to hum, and put a tatur on a stump outside my lodge. Neow, in the mornin,' that tatur was just whar' I put it. Neow, ef the 'arth had turned round, whar' ud that tatur hev' bin—eh?' But he didn't say nothin', but giv' a

*Prairies on the eastern side of the Rocky Mountains.

kind of laugh. 'No,' sez I, 'ef the 'arth turned reound thar' would be the tallest seatterin' uv the nations you ever did see. No, mister,' sez I, 'the 'arth's as flat as a pancake, and I know it.' And with that he vamoozed."

Baillie had been a good deal employed as guide to emigrants (or, as he called them, "emigranters"), for whom he had a supreme contempt. The only job of that sort he ever looked back upon with pleasure was the piloting of a troop of United States cavalry for service in the Indian war of 1855. He greatly admired the "smartness" of the major in command, and the way he settled a troublesome account. They had lost a wagon here, and sold a horse there. A soldier had sold or bartered his carbine now and then; and, in fact, their accounts were in such a state that to present a report and to account for everything to the quartermaster-general was impossible. At last they came to the Columbia River, and to a place where there was a good deal of dry timber. "Are there any falls about here, Baillie?" the major asked. Oh, yes; there were falls not over a mile ahead. "Well, then," the major thought, "we'll build a raft; the road's pretty bad." On the raft was placed a broken wagon, a three-legged mule, five or six broken carbines, an empty cask, and a few other such valuables. The major wished to guide it along with ropes, and, though Baillie assured him that the current was so strong that this was impracticable, he insisted. At last the men shouted that they could hold on no longer. "Well, then, let go!" was the answer; and over the falls in a few minutes went the raft and its contents. "The major cussed a small chance for show's sake," Baillie remarked, "but arter a while he winked, and sed to me, 'I guess that's an A. Q. G.* way o' squarin' accounts!' Everything—and something more, too—that was missing, got scored opposite to it in his book: 'Lost on a raft in the Columbia River!'"

But of all the men Baillie knew, those for whom he had the greatest contempt were the "shootin' gentlemen." Sometimes, when he went down into the settlements, he was asked to act as guide to parties of town sportsmen, his character as a hunter being deservedly high. "They come," Baillie remarked, "in their store clothes, biled rags, and satin waistcoats, with lots of pro-vision and whisky (which ain't to be laughed at, though), though a hunter takin' pro-vision into the mountings with him is the greatest notion I ever heern tell on. Afore they camp at night, they load their rifles, in case of bars; next mornin' they fire 'em off, in case they're damp; and that, Cap'n, as you know, don't bring the deer within a mile or so of the camp. Going out, they see nothin', and swear there ain't no game areound. They then take a few drinks of old rye, which makes them talky, and then they begin somethin' about the darn 'lection ticket, or to shootin' at marks. 'Bout this time they get hungry, and so back to camp, and afore their supper is over it's dark. They then load their shootin' irons again—and so the same old game goes on. Darn me ef it don't, Cap'n! When it's about time fur them to go to hnn, I tell 'em to hold on and not to fire, and so I go out and shoot 'em a varmint of some sort apiece to show when they go back to the settlements as their shootin', they meanwhile pickin' berries and talkin' 'lection. I guess they like that about as well. Then they don't wash their

* Assistant quartermaster-general.

faces for a day, tear their store clothes a bit, and go back to the settlements as big as a dog with a tin tail, and jest about as nat'ral—skulp 'em!"

Baillie in his day had endured many hardships. He had made meals on many anomalous things from the animal and vegetable worlds, including a pair of old mocassins, sage-brush leaves, grasshoppers, and beaver-skins; and had more than once eaten his horse from under him; but he declared that an old carrion crow was the most unpalatable article he ever dined on.* In reference to this (and the phrase he also applied metaphorically to many things in life, which, though not unbearable, are yet scarcely to be wished for) he used to say, "I kin eat crow, Cap'n, but I don't hanker arter it!"

These "free trappers" were chiefly found in the Far West, and in the regions where there was no monopoly of the fur-trade. The Hudson's Bay Company depended on the Indians, and only employed these former expensive and unruly *aides* when the exigencies of competition demanded. The American companies bought chiefly from them, but they had also covenanted servants. These free trappers trapped, as we have said, for no one in particular, but sold to whomsoever they thought to make the best bargain with. Being therefore nearly confined in their operations to United States territory, they were mostly Americans. But as late as 1817 at least there was an old officer of the English army, who had been at Waterloo, who followed this business in his declining years. He was then about sixty, vigorous and athletic, and his manners, intelligence, and general address were quite out of keeping with the rude buckskin costume of the wilderness in which, like the rest of his fellow-trappers, he was clothed (p. 158). At that date Mr. Bryant estimated the free trappers and traders of the Rocky Mountain region at from 500 to 1,000. "Adventure, romance, misanthropy, and sometimes social outlawry have had their influence in enticing or drawing these persons into the savage wilderness." Volumes could be filled with the traditional history of their ways and life, which yet linger in the West. They were simple as children, yet, like all men who live much alone, and, above all, who know some things not familiar to the rest of the whites with whom they now and then come into contact, had an immense opinion of their own importance and acuteness. Some idea of the dangers of their calling may be gained from the fact that it was estimated (p. 180)—by some trader who had given them credit—that after they had once entered upon the business the average duration of their life was not more than three and a half years. Some lived to be old men, and many others were killed off before they had well set their first traps. Yet they loved their perilous trade. The passionate excitement was akin to a mania, and from what I have heard I see no reason to doubt the justice of the summing up of their character which was made by one who knew them well. "No toil, no danger, no privation, can turn the trapper from his pursuit. In vain may the most vigilant and cruel savage beset his path; in vain may rocks, and precipices, and wintry torrents oppose his progress: let but a single track of a beaver meet his eye, and he forgets all dangers and defies all difficulties. At times he may

* In this he agreed with the late Prince Lucien Bonaparte, who remarked on one occasion that in all his ornithological expeditions in America, he had been always able to make a "comfortable meal" on anything he came across, "except a Turkey buzzard and an alligator.

be seen with his traps on his shoulder, buffeting his way across rapid streams amidst floating blocks of ice; at other times he is to be found with his traps on his back, climbing the most rugged mountains, scaling or descending the most frightful precipices, searching, by routes inaccessible to the horse, and never before trodden by white men, for springs and lakes unknown to his comrades, and where he may meet with his favourite game. Such is the mountaineer, the hardy trapper of the West; and such as we have slightly sketched it is the wild Robin Hood kind of life, with its strange populace now existing in full vigour among the Rocky Mountains."

It is fifty years since these words were written, and the West is the West no longer as described in these lines. Railways span the continent; towns and villages spring up like mushrooms. The fur animals retreat from their old haunts, and even become extinct. New trades, quite as profitable and less dangerous, supply an outlet for the energy of the population, and the changes of fashion and the discovery of science have even made the furs, which once gave employment to these hardy men and profit to the fur-traders, no longer of the same value. The fall of the price of beaver in particular rang their death-knell. The few who still pursue the business of trapping do it more owing to former association than from any great profit to be derived from it. Indians and half-breeds have now monopolised this pursuit, and even they, owing to the expense of transportation and the enhanced prices of labour, do not find it sufficiently lucrative to follow, except when no other work offers itself. The world is fast filling in; it has left no place for romance; and the hunter and trapper are among the "provisional races," which must disappear before the plough and the reaping-machine. And perhaps it is better after all.

THE HUNTING GROUNDS.

It is difficult for an untravelled Englishman to grasp a sufficient idea of the extent of the fur countries of North America. They really comprise more or less all British North America and the colder portions of the United States. In familiar parlance the Hudson's Bay Territories—that were—were the part of America included under the designation of the "fur countries." Now, the Hudson's Bay lands, over which they exercised the exclusive right of trade and rule, were British North America, the Pacific end of that large tract, and the Canadian colonies—including Nova Scotia, Newfoundland, New Brunswick, and Prince Edward Island—on the East Coast excepted. From the British boundary line on to the Arctic Sea all was theirs; throughout all this dreary land "the Company" was king, and few kings on the earth had ever such an extensive realm. Rivers and lakes intersected it everywhere. Prairies were in the centre of it; stunted woods to the North, and still further to the shores of the Frozen Sea—on to the very Pole if they chose—stretched the Arctic wastes. From Pembina, on the Red River of the North (p. 189), to Fort Anderson, on the Mackenzie River, is as great a distance as from London to Mecca. From St. Mary's Post to the Pelley banks is further than from Paris to Samarcand. Still, throughout all this large territory the Company is practically the ruler, and more than the ruler, for it clothes, feeds, and maintains nine-tenths of its subjects. The country is thinly peopled by Indians of many tribes. Indeed, a thickly-populated country would be unfavourable

BIRCH BARK CANOES ON THE RED RIVER OF THE NORTH.

to the breeding and increase of fur animals, and as there is almost no cultivation in any part of it, hunting, and trapping, and trading furs, and conveying them to the fur posts, and from the fur posts to the *rendezvous*, are almost the only occupations the country affords. Roughly speaking, the fur countries outside of Canada proper and British Columbia—though all British North America, Newfoundland alone excepted, is included in the Dominion of Canada—may be classed as follows:—There is the wooded region, occupying the country northward from the settlements of Canada along the shores of the Hudson's Bay, and extending down the valley of the Mackenzie and Peace Rivers, nearly to the Arctic Ocean. In this region are several lakes: one of the chief of them is Lake Athabasca, hemmed in on the north and east sides by granite rocks, about 500 or 600 feet in height. It is studded with numerous islets, bristling with pine-trees, which, according to a simile of the Abbé Petitot, gives it the appearance of being studded with masts. The climate is milder than most of the Mackenzie Valley, the Valley of the Peace River being more especially known for its great fertility, and the excellence and abundance of its timber, and its mineral wealth of coal, asphalt, sulphur, gypsum, iron, and gold, especially in that portion of it on the western side of the Rocky Mountains. The Athabasca and Slave Rivers bring down annually a quantity of silt and other *détritus*, which is gradually converting the estuary of the Mackenzie into a huge swamp. The waters of the Great Slave Lake are charged with lime and vegetable matter, and bring down enormous quantities of drift wood and uprooted trees. Lake Aylmer, which runs into the Great Slave Lake, is so close to Lake Sussex, the source of the Back or Great Fish River,* which flows in the opposite direction into the Arctic Ocean, that on many maps the two are joined, and the Great Slave Lake is thus represented as possessing the anomaly of a double outlet. Fort Rae is one of the most important stations in this region. The sandy soil in this vicinity is wholly destitute of vegetation, and wood itself is very scarce. The Great Fish River is rich in salmon, trout, carp, perch, and other fish; the banks are frequented by the trumpeter swan, and a variety of ducks, geese, and other birds, while the caribou, or reindeer, and the musk-ox are plentiful. The Mackenzie itself is—

"A full-fed river, winding slow
By herds upon an endless plain."

The Abbé Petitot estimates its total length at 2,500 geographical miles, and its basin as embracing an area of 2,500 geographical miles. There are only five or six rapids, occasioned by spurs jutting out from the main chain of the Rocky Mountains. There are eleven trading stations in the Mackenzie district, eight residences of French and one of English missionaries; the Athabasca district having eight trading and four missionary stations. The vegetation along its banks is poor. The white fir, birch, alder, aspen, and willow are the chief trees. The Banksian fir is also seen, but gets more and more stunted, until at the sixty-third parallel it ceases. At the outlet of Great Bear Lake, where sometimes the temperature falls as low as 76° below zero, the poplar, according to the observations of Dr. Rae, ceases. The birch and the fir, even the "steppc-fir," cease at 68½°, but willows fringe

* Or rather the Great *Whale* River, that being the "great fish," the presence of which in the estuary lent its name to the river.

the delta of the Mackenzie and the banks of the Peel River. The higher grounds are bare of vegetation except lichens, the *Ledum*, or Labrador tea, which is sometimes employed as a substitute for the Chinese herb, and the *Andromeda tetragona*, which is greatly used for fuel. The Abbé Petitot, a late writer on this region, holds out no encouragement to colonists in this section. The culturable ground is only to be found alongside the Liard River, and in a few uplands, such as that on which Fort Simpson is situated, where potatoes, vegetables, and cereals grow, and even wheat ripens in favourable seasons (pp. 20, 22). The Great Bear Lake is larger than the Great Slave Lake. From October to the middle of July it is covered with ice, varying from seven to ten feet in thickness. The more exposed situations are swept by the most violent snow-storms, called "kamatsan," which often wholly bury its sole trading station, Fort Franklin. Dreary though the region is it is frequented by large herds of reindeer, while the rivers yield excellent salmon and enormous quantities of white fish. The trade done in the region of the Athabasca and Mackenzie Rivers is wholly confined to furs, such as those of the bear—cinnamon, Polar, and grizzly—the fox, lynx, marten, wolf, glutton, ermine, musk-ox, seal, and musk-rat, and the plumage of the trumpeter swan and eider duck. The Athabasca and Great Slave Lakes are rich in martens, lynxes, sables, and foxes. Fort Good Hope yields gluttons (p. 168), beavers (p. 149), wolves, and a few silver foxes, whose skins bring £30 in England, and even £10 in America. "Great Bear Lake is noted for its otters and beavers, which animals are also found along the course of the Mackenzie River, while from the shores of the Arctic Ocean are brought skins of musk-oxen, bears, and white foxes, and swans' plumage." Desolate this region may be to civilised man, yet 60,000 pounds' weight of furs and skins must be annually, on an average, sent out of it. Here money is unknown—beaver being the unit of exchange. A beaver's skin, or *pelt*, as a rule, represents 2s. Thus the skin of a bear, musk-ox, or grey fox is worth four pelts, or 8s.; ermine and musk-rat skins average six for a shilling, and the silver fox skin, the most costly of all, one pound apiece.

The North-West Territory is divided into two districts, of which Athabasca and Mackenzie are the most northern. Each district is, of course, presided over by its chief trader or chief factor. The chief forts, such as Garry, Nelson, and others, are built of stone, but they are thinly scattered over an immense territory. The author from whom we quote gives a good idea of the distances between these stations by comparing one of the districts to France, and imagining a post at the mouth of the Seine, another at Paris, a third at Bordeaux, a fourth at Brest, a fifth at Marseilles, and so on for eight or ten forts. Once a year, in the early part of June, he tells us all the tributary forts in the Mackenzie districts send their furs to the chief station, in canoes and *batteaux*, whence the Mackenzie flotilla convey them as far as the *portage*, La Loche, a journey which takes at least two months. Here the furs are exchanged for European goods, brought by boats, which have come up from Fort Garry or Norway House, and the boats, having exchanged their respective cargoes, retrace their steps. The furs are taken to York Factory, in Hudson's Bay, and from thence are transported to London. The European goods are taken to Fort Simpson, where they are distributed to the officers of the different forts, who are thus enabled to pay their debts to the Indians, and make

advances of ammunition, tobacco, hatchets, knives, blankets, and provisions. The method of paying the Company's officers has somewhat changed since the new *régime* came into power. Still, however, the chief officers have no fixed salary, being allowed a share of the profits. This has never for the chief factors been less than £600, or for the chief traders less than £300. The clerks get from £75 to £100 per annum; the postmasters from £10 to £75; the half-breeds, who take charge of the boats on their annual journeys, from £28 to £45, and the ordinary labourers, or *voyageurs*, £24. All these salaries are exclusive of board and lodging. The white and half-breed population of the Mackenzie district numbers about 1,000, and includes natives of England, Scotland, Ireland (very few), the Hebrides, and Canada. The half-breeds are chiefly Franco-Canadians. The pure French element is centred in the missionaries. There are about 10,000 Indians and Eskimo trading along in the Athabasca and Mackenzie districts, but some of them also frequent the northern parts of British Columbia—especially since the Omineca and Peace River diggings have been discovered—and the United States territory of Alaska.

The "limestone district" in this region, as Sir John Richardson tells us, is especially well wooded, but the woods are, of course, extremely stunted by the northern blasts. Travel is not easy, and the difficulty of transporting supplies, &c., to this far-away section of the fur countries is extremely great; hence the prices which they bring. This question I have already discussed briefly, but as it is little understood I may quote a passage from Colonel Butler, which is thoroughly *à propos* of the point which I wish to impress upon the reader. "The earth," writes the hero of "Akim-Poo," "knows not a wilder spot than the barren grounds of Fort Providence. Around lie the desolate shores of the Great Slave Lake. Twice in the year news comes from the outside world—news many, many months old—news borne by men and dogs through 2,000 miles of snow; and yet even there the gun that brings down the moose and the musk-ox has been forged in a London smithy; the blanket that covers the wild Indian in his cold camp has been woven in a Witney loom; that knife is from Sheffield; that string of beads is from Birmingham. Let us follow one of the ships that sail annually from the Thames bound for the supply of this vast region. It is early in June when she gets clear of the Nore; it is mid-June when the Orkneys and Stornaways are left behind; it is August when the frozen straits of Hudson are pierced; and the end of the month has been reached before the ship comes to anchor off the sand-barred mouth of the Nelson River. For one year the stores that she has brought lie in the warehouses of York Factory; twelve months later they reach Red River; twelve months later again they reach Fort Simpson, on the Mackenzie. That rough flint gun, which might have done duty in the days of the Stuarts, is worth many a rich sable in the country of the Dogribs and the Lonehianx, and is bartered for skins, whose value can be rated at four times their weight in gold; but the gun on the banks of the Thames and the gun in the pine woods of the Mackenzie are two widely different articles. The rough old flint, whose bent barrel the Indian will often straighten between the cleft of a tree, or the crevice of a rock, has been made precious by the long labours of many men; the trackless wastes through which it has been carried; by winter famine of those who have to vend it; by the years which elapse between its departure from the workshop and the return of that skin of sable or silver fox for which it has been bartered. They are

short-sighted men who hold that because the flint gun and the sable possess such different values in London, these articles should also possess their relative values in North America, and argue from this that the Hudson's Bay Company treat the Indians unfairly. They are short-sighted men, I say, and know not of what they speak. That rough old flint has often cost more to put it in the hands of that Dogrib hunter than the best finished weapon of Boss or Purdy. But that is not all that has to be said about the trade of this Company.

ON THE UNION PACIFIC RAILWAY.

Free-trade may be an admirable institution. Unfortunately for the universality of British institutions, free-trade has invariably been found to improve the red man from the face of the earth. Free-trade in furs means dear beaver, dear martens, dear minks, and dear otters; and all these 'dears' mean whiskey, alcohol, high wine, and poison, which in their turn mean, to the Indian, murder, disease, small-pox, and death. . . . Now, the Hudson's Bay Company are in the position of men who have taken a valuable shooting for a very long term of years, or for a perpetuity, and who, thereupon, are desirous of preserving for a future time the game which they hunt, and also of preserving the hunters and trappers,

who are their servants. The free-trader is a man who takes his shooting for the term of a year or two, and wishes to destroy all he can."*

The names given to the forts express the minds of the men who named them—"Resolution," "Providence," "Good Hope," "Enterprise," "Reliance," "Confidence." The life of the "wintering partners" was hard. "God knows their lives were hard. They came generally from the remote isles or Highlands of Scotland. They left home young, and the mind tires when it thinks upon the remoteness of many of these fur-stations. Dreary and monotonous beyond words was their home life, and hardship was its rule. To travel on foot 1,000 miles in winter's darkest time, to live upon the coarsest food, to see nought of bread or sugar for long months, to lie down at night under the freezing branches, to feel cold, such as an Englishman in England cannot comprehend, often to starve, always to dwell in exile from the great world—such was the routine of their lives. Who can tell what memories of early days in the far-away Scottish isles or Highland glens must have come to these men as the tempest swept the stunted pine-forest, and the wreck and drift hurled across the frozen lake, where the dawn and the dark, separated by only a few hours' daylight, closed into the long, dark night. Perchance the savage scene was lost in a dreamy vision of some lonely Scottish loch, some Druid mound in far-away Lewis, some vista of a fireside, when the storm howled and waves ran high upon the beach of Stornoway."† And dreary little "forts" they are, in many cases only a few huts roofed with pine bark, without pickets, bastion, guns, or aught else that we associate with a fort. Sometimes the anomaly of the name is too much, and they are called "houses," or simply "posts." The white fish (*Coregonus albus*) is the staple of this dreary region in the winter. It is an inhabitant of all the lakes, and is celebrated for the delicacy of its flavour. Dr. King describes several Indian tribes as subsisting upon it; and at many of the fur-trading posts it forms the principal food for eight or nine months in the year. It is a rich fish, but so pleasant is it to the palate that instead of causing in time satiety it becomes day by day more agreeable; so much so, indeed, that those who live upon it, though deprived of bread and potatoes, never tire of it. When in season it is loaded with fat, particularly between the shoulders, where it forms a considerable lump. The thick-walled stomach is considered a particular delicacy by the *royageurs*. In October the "attchawmeg," as the Crees call it, the *poisson blanc* of the French-Canadians, quits the lakes and enters the rivers to spawn. "It somewhat resembles a herring, and like that fish speedily dies when taken out of the water. It generally weighs two or three pounds, but has been known to attain to seven or eight. The fish are taken in winter with gill nets. Holes are made in the ice with a chisel, at a distance of ten or twelve feet from each other, according to the length of the net, when a line is passed beneath them by means of a long pole, and readily conveyed from one hole to another, with the assistance of a forked stick, until it arrives at the last. The net is then strung upon the line, to the end of which a large stone is fixed, to keep it from expanding and rising from the bottom with every waft of the current, as it otherwise would do. In overhauling or searching a net, the two extreme holes only are opened, when the net is veered away by one person, while the net is hauled from under

say—and not improperly—unknown to the Italian Opera, but of which the chorus contains the ominous refrain—

“For the time is drawing nigh.”

He is a very foolish man who would attempt to resist on these occasions, and accordingly all the “green-hands” connected with the cabin (almost invariably the surgeon, the steward, and possibly a stray naturalist who unthinkingly has taken passage northward) are marched off

WHALER WITH BOATS FAST TO A “FISH” (WITH THE GUN HARPOON).

by the constable and his men armed with broomsticks. Neptune is received by all the idlers in the ’tween decks, brilliantly lighted up, and draws lots for the order of precedence. Generally the “officer and gentleman” passenger, if anything of a favourite, is let off very lightly, the probabilities having been that already he has secured an almost entire immunity by sundry gifts of grog and tobacco in an early portion of the evening. The others are marched in successively—all blindfolded—amid blowing of trumpets and every conceivable noise and hubbub that can be conjured up on board a ship with a crew of seventy men, each more intent than the other on fun and frolic, the roughness of which is the chief element in it. We, of course, like unfeeling wretches as we are, sit round quite unconcerned, enjoying the trepidation of our comrades, proving to a demonstration the truth of Rochefoucauld’s bitter maxim, that every-

CHAPTER X.

THE FUR COUNTRIES: THE FUR ANIMALS.

To enumerate the chief animals the skins of which have been employed either as articles of dress or as materials to decorate the garments of civilised races, is not a very difficult task. Now one is in fashion, now another. In one year some particular animal is prized for its hide, and unless the fashion declines, the unfortunate idol of female vanity will get almost hunted to death. In a short time, however, caprice will reject it for another, and then the discarded favourite will have space to increase and multiply in the wilds which are invariably its home. Nearly all the mammals of the fur countries yield "peltries." Even the birds' skins find a market in Europe and civilised America. The swans, geese, and ducks are of many species, and are found in enormous abundance. In the winter they collect in millions at the mouths of the rivers, and wherever any open water is found. The air is alive with their cries, and at any alarm they arise in clouds from their swampy feeding-grounds. Another most characteristic bird of the fur countries is the white-headed or sea-eagle (p. 185). It is equally familiar perched on a rock on the shores of Hudson's Bay or Vancouver Island, or on the branch of a blasted pine in the heart of the Continent, watching an opportunity to dart on the fish which its keen sight may have detected in the waters beneath. It is, however, applied to no useful purpose, as are most of the other numerous birds found through the wide stretch of North America, and which have been described in many volumes.* Neither space nor the general interest of the subject will admit of any but the more important fur animals being described in this chapter. Chief among these are the sables or martens. The true Russian sable (*Mustela zibellina*) is not found in America. The darker skins are much valued, these bringing three times as much as many of the poorer ones. In Henry VIII.'s reign the wearing of sable was prohibited to all below the rank of viscount. In America are, however, to be found several species of marten. Among these animals the principal place is due to the Hudson's Bay sable (*M. americana*), of which about 120,000 are annually bartered at the Company's posts. It is lighter in colour than the Russian sable, but nearly all of those which are sold in the shops are artificially darkened in colour. It is in the highest order—like most furs—in the winter-time, when the lustre of the surface is great. At the commencement of summer the dark tips of the hair drop off. This alters its colour to a pale orange-brown, little lustrous, and on account of its light colour, of little value. When bought, the trader tests its value by suspending the skin by the tail, and seeing how the long hair falls back, revealing the fine downy fur beneath. In 1836, at Cumberland House, three martens were bought for a coarse knife worth about sixpence, though the same skins could be sold in London for at least five guineas. In Vancouver Island,

* Richardson: "Fauna Boreali-Americana;" Baird's "Birds of North America," &c.

JUNCTION OF BROWN'S RIVER WITH THE PUNTLEDGE, VANCOUVER ISLAND.
[From an Original Sketch by Mr. Frederick Whymper, Artist of the First V.I. Exploring Expedition, under the command of Dr. K. Brown.]

owing to the comparative warmth of the climate not permitting of a heavy growth of fur, the marten is worth little or nothing. I saw many in the vicinity of Brown's River, near the centre of the island (p. 127), but neither the Indians nor the hunters attached to our party cared much about killing them. On the other hand, those from the Northern Rocky Mountains are worth from fifteen to twenty dollars. Even in Canada there is a great variety. Skins taken north of the St. Lawrence in the Labrador direction are worth from 20s. to 25s., while those of New Brunswick are not valued at more than 5s. or 6s. These animals appear periodically in vast numbers, which the hunters regard as presaging heavy falls of snow, and accordingly a good trapping season. They feed on mice, hares, small birds' eggs, and partridges. They are found everywhere except on the barren grounds, to which, being arboreal animals, they do not resort. Their periodical disappearances are very remarkable, in so far that, wherever they go, it must be to some region where there are no fur-trading posts; yet no track has been found of their retreat. This takes place about once in ten years—with great regularity—and the scarcity occurs simultaneously throughout the whole fur countries. They are caught, according to Mr. Bernard Ross's description, in wooden traps baited with white-fish heads, pieces of dried meat, or, still better, with the heads of wild fowls, which the natives gather for the purpose in the autumn. When they are at their lowest ebb they will scarcely bite at all, hence it seemed as if "Providence had implanted some instinct in them by which the total destruction of their race is prevented." They are not difficult to tame, and when enraged they arch their back and hiss in a manner somewhat like the domestic cat.

The fisher, black cat, or peccan (*M. Pennanti*) is another species of marten. It is the Chippeweyan *Thâ chô*, or great marten, and in appearance bears a strong family likeness to both the wolverine and its other congeners. Its habit and food are much the same as its relatives, and to a marten-hunter it is almost as great a pest as a wolverine. Being very powerful for its size, it will tear down the wooden traps with ease. "Its regularity in visiting them is exemplary. In one quality it is, however, superior to the wolverine, which is, that it leaves the sticks of the traps lying where they were planted; while the other beast, if it can discover nothing better to hide, will *câche* them some distance off." It is easily caught in the steel trap, in much the same way as foxes. About 11,000 is the average number imported from North America. At one time its tail was worth from 6s. to 9s., and formed a common ornament of the cap of the Polish Jew. It is now only worth about from 6d. to 9d. The fur, though coarse, is valued from its black colour, and brings from £2 to £4. The skins of tame black cats, with the tail and ears cut off, have been imposed on people ignorant of furs as those of the "fisher"—why so called it is difficult to say, as it does not go near the water.

The baum marten (*M. abietum*) and the stone marten (*M. saxorum*) are both European species. Their fur, when dyed, forms a near imitation of the best sable. The latter is often called the French sable, because the French excel in dyeing it of a natural hue and gloss. By some naturalists—and not without reason—the American pine marten is looked upon as only a variety of the Siberian or Russian sable, and indeed some of the so-called species are considered to be only climatic varieties of the others.

The mink (*Putorius vison*) is another well-known fur animal. The American species

is said to be different from that of Europe, but by many the *Mustela lutreola* of Norway is believed to be identical. It is aquatic, and an expert fisher, yet lives much upon birds, mice, and other small animals. It is easily captured by any kind of trap, and more generally by what are called "dead falls," such as are commonly used to catch various fur animals, by making them pull a log or other weight down on themselves when they are tugging at the bait. It is also caught in traps like those employed in the capture of the martens. In length it is twenty inches on an average from the tip of the nose to the root of the tail, and the tail itself is about ten inches in length. It is found all over the North American Continent, and though another species (*P. nigrescens*) has been described in Audubon and Bachman's work on "American Quadrupeds," it is probable that this is merely the common mink under three years of age.* *P. longicauda* and *P. noveboracensis* are more doubtful.

In 1880, 250,000 were traded in North America. Of late years it has risen in price, and several years ago it rose from 1s. to 12s. or 14s. This was very fatal to the mink—so fatal, indeed, that there was an attempt to breed it in domestication. The "minkeries," however, Mr. Rowan tells us, did not pay, the fur of the tame mink being much inferior to that of the wild animal. Its average trade value is a little over 2s.

The wolverine, or glutton (*Gulo luscus*, p. 168) has been the subject of endless misrepresentations and fables by the earlier writers, and its history is to this day surrounded with a good deal of mystification. The account in Goldsmith is probably the best and most innocent summary of all the errors which had been written on it up to his time. Its habits are similar to those of the marten, but though, as a rule, it lives on birds, hares, and mice, it will occasionally kill sickly or disabled deer. The chief thing remarkable about it is that it follows the footsteps of the trapper to prey on the hare, marten, beaver, or other animal that may be caught in his trap, or to feed upon the bait; or perhaps it is directed by scent to the trapped animals, as it is almost impossible to fully believe in the intelligence of an animal which understands the mission of a hunter. The very strongest *caches* or concealed stores it will break into, and after satisfying its hunger it will carry off all the pieces of meat to some distance, and then bury them in the snow. Mr. Ross tells us that their hidden stores can be recovered by following the animal's footprints, but in general they are quite uncatchable, as the wolverine, to protect its secret hoards from the attacks of other beasts of prey, besprinkles all its larder plentifully with its urine, which has a strong and most disagreeable odour, and proves a good preservative in most cases. "But the desire for accumulating property," writes the eminent fur-trader and accomplished naturalist, whom we have already quoted, "seems so deeply implanted by nature in this animal, that, like tame ravens, it does not appear much to care what it steals, so that it can exercise its favourite propensity to commit mischief. An instance occurred within my own knowledge in which a hunter and his family, having left their lodge unguarded during their absence, found it on their return completely gutted; the walls were there, but nothing else. Blankets, guns, kettles, axes, cans, knives, and all other paraphernalia of a trapper's tent,

* Ross: "Canadian Naturalist," Vol. vi. (1861), p. 30.

had vanished, and the tracks left by the beast showed who had been the thief. The family set to work, and by carefully following up all its paths, recovered, with some trifling exceptions, the whole of the lost property. The damage which it does to a trapping-road is very great; indeed, if the animal cannot be killed it is as well to abandon it, as it will not only break the traps and eat the bait or animals caught, but also, out of sheer malice, will carry away the sticks and hide them at some distance. To kill or catch it is very difficult. An old stager is a regular bugbear to the Indians. 'Master,' said one

FUR ANIMALS: THE LYNX. (*Lynx canadensis*.)

to me, in his own language, 'I can't hunt furs; the wolverine eats the martens and baits, and smashes my traps. I put a steel trap for him; he got in, but released himself by screwing off the nuts confining the spring with his teeth. I set a gun; he cut the cord attached to the trigger, ate my bait, and broke the stock; what shall I do?' As the infallible strychnine had not then made its appearance in those parts, I could offer him neither advice nor assistance, and but little consolation." Its centre of range is in the coldest portions of the North; it has even been known to visit Melville Island, in lat. 75°. The fur of the wolverine is of a dark nut-brown, and is chiefly used in Germany for trimming cloaks.

The American wolf is found in several varieties—or species, as they are called by

some. They are shot, trapped, caught by pitfalls, and poisoned, especially by strychnine. The type of them all is the grey or strongwood wolf (*Canis occidentalis*, var. *griseus*). There are at least five species of fox in North America, the black, silver-grey (or kit fox), and cross fox being varieties of *Vulpes fulvus*. The black and silver-grey are highly valued as furs, the skins often bringing from £8 to £15, and sometimes even higher. He therefore is a fortunate trapper who can bring to a trading-post a few of these skins.

BULLOCK TEAM ON "THE PLAINS."

It is seldom seen in this country, only the luxurious Russian nobles, and others of like wealth and taste, buying it.

Foxes are captured by wooden traps, by gin or steel traps, by set guns, by snaring, by hook and line, by hunting, by unearthing, and by ice traps. Hook and line is an out-of-the-way method adopted for capturing a land animal. It consists simply in baiting a hook with a fish or other substance, watching the bait, and when the fox bites hauling it in and killing it before the fox has time to cut the line. It is more a curiosity in "trapping," than anything else. Ice traps are more successful than wooden ones. A block of ice of some weight is tilted on end at an angle of about 45°. A piece of stick supports it, the lower end resting on the bait. The fox enters the trap, and in tugging at the bait brings the block of ice down upon him, when it either kills or imprisons him until the hunter arrives and gives the unwary Northern Reynard the

coup de grâce, if indeed he does not already find him frozen. The Yellow Knife Indians and the Eskimo also adopt this method of capturing the white foxes of the shores of the Arctic Ocean.

The Canadian otter (*Lutra canadensis*)—"a magnified mink"—is also a valuable fur animal, which is extensively trapped for its skin; its flesh being rank and unpalatable. Unlike the beaver, when caught it does not leave its foot in the trap, and escape. A good skin is worth from 30s. to 60s., but there is nothing which varies more in price than furs, fashion being the main agent which regulates the fluctuation of the prices.

The *Lutra californica* is probably a distinct species found on the Pacific coast. The Chinese and Russians use the fur, but it is inferior to that of the British otter, about 500 of which are annually collected. The sea-otter (*Enhydra marina*) is quite a different and infinitely more valuable fur. It is found in the North Pacific, and will be noticed in due course.

The raccoon (*Procyon lotor*, p. 209), and the lynx, or loup-cervier (*Lynx canadensis*, p. 200), we can only mention as well-known animals of North America—a variety (*P. Hernandezii*) of the 'coon being also found on the North Pacific shores. Its skin is now little valued. The skunk (*Mephitis americana*, *occidentalis* and *bicolor*) may also be passed here as hastily as the reader, if he were wise, would pass this *enfant du diable*—as the *voyageurs* call it—in its native haunts; while the herds of buffalo which roam the great central plains of America are too well known to need more than a mention in this place. The musk-rat, or musquash (*Fiber zibeticus* and *F. osoyoosensis*), is more interesting. It forms "houses" something like those of the beaver. The Indians kill them by spearing them through the walls of these houses, making the approach cautiously. Their flesh is eaten by the trappers, but it is not to be commended. There are at least four varieties of it—the black musquash, the pied musquash, the white musquash, and the ordinary brown one. About four million skins are annually traded over America, but since it has ceased to be used as a napping for hats it is not so highly valued. It is also used as a "lady's fur," but the skins, though very pretty, are not worth more than from 6d. to 3s. in Canada.

The stoat, or ermine (*Mustela erminea*), is probably as well known in Europe as in America, and its fur is also extensively used for the less expensive description of trimming. In the time of Edward III. it was, however, restricted to the Royal Family, and it is still the fur with which the robes of judges are trimmed. The black spots are supplied by the animals' black-tipped tails. "Miniver" is ermine studded with black spots made of the skin of the black Astracan lamb, and worn by people of certain rank on State occasions in England. In summer the skin is brown, and of no value. It is only in the winter or white coat that it is called ermine by the fur-traders, and known in commerce. In the time of Charlevoix it was exported from Canada, with other small furs, under the title of *menues pelleteries*. It is everywhere numerous, but very few are now imported into England, the value being so trifling as scarcely to repay the cost of collection. In Siberia and Norway, however, they are a considerable article of trade, being taken in the former country in traps baited with flesh, while in the latter they are, according to Dr. King, either shot with blunt arrows, or taken as garden-mice are in England—by a flat stone propped up by a baited stick, which falls down on the least touch and crushes them. In winters of unusual severity it is said

to migrate, but generally it prefers, if within reach of a fur-post, to domesticate itself in the trader's house, where it may be heard the livelong night pursuing the *Mus leucopus*, or white-footed mouse, on which it feeds. On the northern shores of Smith's sound the officers of the *Alert* and *Discovery* found great numbers preying on the lemming, and in their turn were devoured by the snowy owl (p. 137).

Lynx, we may add, is used for cloak-linings and facings. The demand is considerable, and the animal is only referred to for the sake of describing the medicated cabin in which it is caught, in describing which we shall borrow the notes of Mr. Bernard Ross, on the fur animals of the Mackenzie River district. It is the most efficacious method of capturing the animal. "A round inclosure of some three feet in diameter is made of small willows or branches of trees, loosely planted in the snow, and about four feet high. Two entrances are left at the opposite sides, each fitted with a snare. In the centre of the inclosure the medicated skin is placed, inserted in a cleft stick about eight inches distant from the snare. The snare is more commonly tied to the middle of a loose stick, about thirty inches long by three in diameter, and which is supported on two pronged branches set on each side of the entrance. When circumstances are favourable, the 'tossing-pole' is sometimes used, and it is the most certain fashion. The animal, on scenting the castoreum, inserts its head, or sometimes its fore-foot, into the noose, which, owing to the long tips on the lynx's ears, remains securely on the neck when once passed there. After enjoying and rolling itself in the perfume, it moves off, but on finding the stick thumping after its heels it becomes alarmed, and makes for the nearest woods. The stick soon catches in the bushes, and in a short time the animal, instead of cutting the line, strangles itself, or, if caught by the paw, remains fixed until the hunter arrives to give it a *coup de grâce*. On some occasions it will gain the top of a lofty tree, and on springing off, to rid itself, as it fancies, of the stick, it hangs itself in a superior manner, and puts the trapper to the trouble of cutting down the tree, which is generally a large one." The lynx is also valued as an article of food, both by the Indians and the "winterers." The beaver is also attracted by its castoreum quite as surely as the lynx; hence the trapper's affirmation of anything being very certain is that it is "sure—sure as beaver medicine."

The beaver (*Castor Canadensis*, p. 149) was at one time the most important of all the fur animals. Owing to its low price, it now ranks among the least important, and as the habits of the animal have been often described, among others by the author,* it is unnecessary to dwell upon its natural history, about which much nonsense has been written. When the price fell, the animal was getting extinct. It has now multiplied again; but of late years, owing chiefly to the growing scarcity of other furs, beaver has again been rising in price. The country is also getting opened up, so that we may soon expect this as well as other furs to have a higher value than from 4s. to 12s. per lb.

The habits of the western (Pacific) beaver are, I believe, different from those of the beaver as found in Canada and the country east of the Rocky Mountains, though the species seem the same. I have never heard of the nicely-plastered, dome-shaped house in the former region, though all writers agree that they are found in the latter

* "Journal of the Linnean Society" (Zoology), Vol. x.

part. On the western slope of the Rocky Mountains their "houses," when they have any—for they sometimes live in holes in the banks—look like a large bundle of sticks thrown on the surface of a pond or still river-reach. They, however, always, when necessary, erect dams across streams. This is done for many reasons—to deepen the water round their camp, enabling them to dive and so escape, and also to float down trees they may have cut on the banks, as a protection against severe winters which would freeze shallow water to the bottom, to prevent their beds being flooded, and therefore to equalise the height of water throughout the year, and, according to Mr. Rowan, "for the amusement it affords them." If there is likely to be a freshet, they will cut an opening in their dams, and so let the water off.

When forced by the *res angustæ castrensæ* to live on beaver while exploring the interior of Vancouver Island, we used to break down their dams—and that, even with the aid of the axe, was no easy matter—and shoot the beavers out of ambush when they came down stream in a hurry to see what was the matter. It was cruel sport, but the hunter's life is not, at best, a very humane one, and hunger generates a loose code of morals.

For the trapping of beavers I must refer the reader to Mr. Rowan's work on Canada, the special treatise by Mr. Morgan, and to my own paper and the references there given, only cautioning him that he must not believe all he hears about the beaver. It is an intelligent—very intelligent—animal, but it is not superhuman in its wisdom. It weighs, when full grown, over 40 lbs., and its flesh, when smoked, is by no means contemptible. In the Hudson's Bay Territory—that was—we have seen that beaver is the standard of trade. In former times it was also the currency of the backwoods settlements of the United States and Canada, and to this day it forms the crest of the young Dominion. The beaver has also influenced the physical features of the countries it is found in. Some of the smaller lakes and many of the meadows in the beaver country are due to them. "First of all, the small brook is dammed; by and by the dam becomes solid, and forest trees take root and grow on it; as other outlets of the water occur they are closed by these indefatigable workers; till at length the pond assumes the proportions of a lake, and remains for all time to attest to their powers. The meadows are formed by the draining of the lakes. The beaver has left more permanent and enduring monuments of its existence on the surface of the country than the aboriginal inhabitants of Canada have left, or are likely to leave." *

The black bear (*Ursus americanus*) and its variety, the cinnamon bear, range over all North America, as does also the grizzly (*U. horribilis*). The Polar bear is limited to the shores of the Arctic Ocean (Plate III. and p. 137). The first is chiefly a vegetable feeder, and unless when the female is guarding her young, is very harmless. The grizzly, on the contrary, is about the most ferocious animal on the American continent, and is avoided rather than sought after by the hunter. Brown bears are numerous in the wilder sections of Canada, in some parts of which a reward of three dollars is given by the Government for every one killed, on the ground that their extermination is desirable, owing to the damage they do to flocks.

* "The Emigrant and Sportsman in Canada," by J. J. Rowan (1876), p. 376.

AN OLD SQUAW POUNDING WILD CHERRIES: A SCENE IN THE RED RIVER COUNTRY.

By some the "barren ground" bear (*U. arctos*) is believed to be different from the grizzly. It is certainly identical with the brown bear of Europe. The skins of the bears are used for making rugs and hammer-cloths, and in America for sledge-rugs.

The deer are not fur animals proper, but they are nevertheless characteristic members of the North America fauna.

The moose (*Alces americana*), the largest of the family to which it belongs, is found over most of the wild portions of British North America, though rarer on the western side of the Rocky Mountains than in the eastern wooded regions. It is by no means an elegant-looking animal, and has the appearance of an "immense Roman-nosed horse," with a long flexible upper lip, which forms a movable snout, like a short proboscis. It is hunted in March and September. It would be useless to follow it when the snow is soft, as it can then wade through it without difficulty, but when there is a thin crust on the surface this greatly impedes the progress of the animal, as it has to lift its feet perpendicularly out of the snow, or cut the skin around the shanks. Their sense of smell is so acute that to get near their "yard" it is necessary to approach them like most other deer, against the wind. The slightest creak of a twig will startle and alarm them, when they instantly start off on a long trot, which they never abate until fatigue compels them to give in. If a large dog be used to hunt them it will be soon trampled to death. Accordingly, several small curs are usually employed. They do not attack the moose, but annoy it by snapping at its heels. If pressed, the male usually fights, thus giving the hunter time to come up and dispatch it while it is occupied with the dogs. "Sometimes," writes Mr. Kendall, "they are killed after a run of an hour; at other times you may run all day, and have to camp at night without a morsel of provisions or a cloak, as everything is let go the moment the moose starts, and you are too much fatigued to retrace your steps to procure them. Your only resource is to make a good fire, and comfort yourself upon the prospect of plenty of moose meat next day. As soon as the animal finds he is no longer pursued, he lies down, and the next morning he will be too stiff to travel far." Generally a male, female, and two fawns are found in a yard. In September it is also killed by two persons selecting a moonlight night to go out along the borders of a lake in a canoe. They then imitate the cry of the male, which, jealous of intruders, rushes down into the water. When it comes near they fire, and if it be not killed outright they follow it in the woods to which it has taken itself next day by means of the dripping blood. Its flesh is good, though coarse, and is tougher than any other kind of venison. The nose and tongue are the tit-bits.

The barren ground reindeer (*Rangifer tarandus*) is another typical animal of the fur countries (pp. 96, 125).

The woodland caribou (*Rangifer caribou*), another species of reindeer, is found in Labrador, Northern Canada, and over the continent to British Columbia. Its name has been applied to the celebrated gold-diggings of that name in British Columbia, on account of the discoverer finding reindeer near William's Creek. It is different from the European species, though, like it, it travels in herds of from eight or ten to two or three hundred. The Indians kill them with bow and arrow, or gun, take them in snares, or spear them in crossing rivers or lakes. The Eskimo also snare them in ingenious traps made of ice or

snow. They are so easily approached and slaughtered that an Indian family will, it is said, sometimes kill two or three hundred in a few weeks, for their tongues alone.

The wapiti, or Canadian stag (*Elaphus canadensis*), is known as the "elk" on the Pacific coast, where it is found abundantly, and highly valued for its venison. Its magnificent antlers average thirty-five to forty-five pounds in weight, but will often attain to a much greater size. They sometimes measure six feet from tip to tip, and eleven inches in circumference above the butt.

Of the deer we need only mention the common species (*Cervus virginianus*), the white-tailed deer (*C. leucurus*), the mule deer (*C. macrotis*), and the black-tailed, of the Pacific slope (*C. columbianus*).

There are various species of fur seal used, the hunting and nature of which we shall have occasion to speak of by-and-by. The hair seals are chiefly used for making leather, and have no value in the eyes of the fur merchant. Hares, especially the white Arctic and Alpine species, are used as linings for cloaks, but though beautiful when dyed, are not durable. At one time they were much used as a substitute for fur, but this employment of them is now nearly discontinued. Rabbit skins are also dyed to imitate other furs. They are also used by hat-makers, and by the Poles to line their coats and cloaks. Squirrels of various species are classed among the fur animals, but are chiefly in demand for Russia. About 6,000,000 are sold. Several of the better class are dyed to imitate sable. They are made into coats and muffs, and the hair to a small extent is employed in the manufacture of artists' pencils. The fur is light, and tolerably durable. The badger, both the European and the American species (*Taxidea vulgaris*, *T. americana*, and *T. labradorica*), is classed amongst the coarser furs. The hair of the European species is, or was, however, chiefly used in this country to make shaving-brushes.

These are the principal fur animals of America; but though the bulk of our furs comes from that country and Siberia, yet we are not dependent solely on them for the supply. The fitchet, or polecat of Europe, the kolinski of Northern Asia, the nutria, or coypou, of Buenos Ayres and Chili, the hamster of Central Europe, the perwitzky of the South-eastern territories of Asiatic Russia, the chinchilla of South America and Africa, the ordinary domestic cat (bred in Holland for that purpose), the opossum, the dasyure, or Australian cat, the goat, sheep, the marmot, the colobus of Africa, the Diana monkey, and even others, are known in commerce. But it would be foreign to our plan to describe them now, more especially as we may have occasion in due time to touch upon the animals which supply them, as they come before us in the countries in which they are respectively found. It may, however, be convenient to present in this place a brief synoptical summary of the whole fur-trade, more especially as an opportunity to do so will not occur again. It need scarcely be remarked, after what we have said, that *all* of the furs enumerated are not found in the *fur countries* of America. It is difficult to present tables showing the prices paid for furs in different parts of the fur countries. These vary slightly at different times, but still more so in different localities. Above all, the prices which the furs bring in England differ very widely year by year. The most recent quotations have been given in the preceding pages. However, the following list, compiled nearly fifty years ago, is valuable, as exhibiting the price of five principal furs in a "palmy" epoch of the fur-trade, and is useful as showing the relative value of the furs

"in the country" and in London, and also the proportionate value of one fur to another. It was obtained from official materials, and relates solely to the region east of the Rocky Mountains embraced in the "Royal Licence" of the Hudson's Bay Company. At that time the "Western District" was almost a *terra incognita* :—

The following list of the numbers of the chief furs imported into England is only approximate, being drawn up from materials obtained at various dates within the last twenty-five years :—Raccoon, 500,000 ; beaver, 60,000 ; chinchilla, 85,000 ; bear, 9,500 ; fisher, 10,000 ; red fox, 50,000 ; cross fox, 4,500 ; silver fox, 1,000 ; white fox, 1,500 ; grey fox, 20,000 ; lynx, 55,000 ; martens, 180,000 ; mink, 245,000 ; musk-rat, 1,000,000 ; otter, 17,500 ; fur seal, 15,000 ; wolf, 15,000 ; stone and baum marten, 12,000 ; squirrel, 3,000,000 ; fitch (polecat), 65,091 ; kolinski, 53,410 ; ermine, 187,104 ; rabbit, 120,000 ; wolverine, 11,200 ; skunk, 1,200 ; sea-otter, 100. Of course, a large proportion of each of these furs is exported. For instance, in a list published in 1851, it was reported that no wolverine, skunk, or sea-otter were used in this country. Up to the time of the Great Exhibition in 1851, monkey was also an unknown fur. But at that time, according to Dr. Lankester, some black monkey skins, belonging to the genus *Colobus*, attracted the attention of a London fur-dealer, much to the misfortune of the ape family. Since that date they have had little peace, and have

been killed by tens of thousands in the African forests. But the negroes, being thus induced to make war with monkeys, ceased to some extent to do war among themselves, and being

FUR ANIMALS: THE RACCOON (*Procyon lotor*).

able to sell the black skins to England, had not the same temptation to sell their black brothers to America. Furs are all brought to this country unprepared, but in the trade are divided into felted furs and dressed furs. The former are used for hat-making, and are confined

to a few animals which possess hair fit for felting. Hare, rabbit, neutria, beaver, &c., are the chief ones employed; but the demand is not nearly so extensive as it once was, as silk is found to be a much more economical material for hat-making than "beaver." The particular furs in demand in the chief fur-consuming countries of the world are shown in the following table, to which the same remarks apply as to the others:—

Countries to which Imported.	Fox.	Marten.	Otter.	Raccoon.	Musk Rat.	Beaver	Hare and Rabbit.	Goat.	Sheep and Lamb.	All other furs according to value.

The tricks of trappers in America, and of fur-dealers in England, would lead us far beside our subject. Suffice it to say that both are not unknown. When beaver is valuable, the former were in the habit of rubbing blood and sand into the flesh side of the skin to weighten it. To blacken fox-skin is a lucrative bit of knavery, and if skilfully done, has been known, even in modern times, to impose on men by no means in their noviciate in fur-trading. To sew the head and tail of a valuable fur on to the body of a similar, but much less valuable one, is likewise an ancient fraud on very young traders. The fur "manufacturers" are also in their own way not ignorant of the tricks of trade; but space will not admit of touching on this branch of our subject. The fair wearers of furs may, however, rest assured that they are not always wearing the skin of the animal which the label professes it to be. Beaver is often passed off for seal-skin, and the sable, of the *pelissier*, is not invariably that of the zoologist.

The Hudson's Bay Company have, or had, sales of their furs three times in the year. In January the she-bears and musquash from Canada, Labrador, and Hindson's Bay are disposed of. In March, bears, foxes, otters, wolves, fishers, martens, and minor furs from the same regions, are in the market; while in September the peltry from North-West America is sold. The other fur companies follow suit. The prices vary much from year to year. For instance, raccoons have been as low as 6d., and on one occasion, when fashion made a demand for them, they ran up to 58s. each.

I have written so much about the trapper, that the reader might be spared anything more. However, in concluding what I have to say about the wide and interesting fur countries, and the varied and valuable fur animals, I may be allowed to end this chapter with a passage

from Mr. Rowan's work relating to trapping life in Canada. It expresses so well what I had intended saying, that it is only just to give it in the words of the writer who has anticipated me in the publication of it:—"I suppose there is no man who has more pity wasted upon him than the solitary trapper. In the opinion of those who are uninitiated in the mystery of woodcraft, he is the most wretched of mortals. For months and months, often for a whole year, he lives quite alone in the forest, or else with one comrade only. He does without the comforts of civilised life, and the pleasures of society. He has no church to go to on Sunday; no doctors to prescribe to him if he is ill. In fact, in the opinion of the gregarious city man, his condition of life is little, if at all, better than that of a prisoner in a dungeon. But there are two ways of looking at most subjects, and the trapper's life is no exception to the rule. The forest is the trapper's home; there are all his friends, not human only, but not less dear on that account. He thinks, and I who have tried the life fully enter into his feelings, that there is no mode of existence so enjoyable as that of the trapper in the Canadian forest. He has no church near, it is true, but it by no means follows that he has no religion. On the contrary, there is a religion in the pine forest. Nowhere else does he feel so utterly and entirely dependent on the Giver of all good. He has no doctor to consult, but, except in cases of accident, he never wants one; there is no bad drainage in the wood, no bad smell, no bad ventilation, no epidemics; he has a daily and nightly tonic in the bracing air; and the pure water is the best of medicine. He has no time for dyspepsia and its companion the 'blues;' his fare is simple, but his appetite is good; and on his fragrant bed of boughs, after his hard day's labour is over, he sleeps the sleep that the city man could not buy for millions. To him there is no loneliness so unbearable, no solitude so wearisome, as the solitude of a great city. True, in the latter case he sees thousands of his fellow-creatures every day, but of what use are they to him, or he to them? If, while gaping in amazement at the human hive, he happens to get run over by a cab, one or two passers-by may turn round to look at him, or even say, 'Poor fellow!' but that is all. Truly, in the trapper's opinion, the loneliness of the city is infinitely more oppressive than that of the forest." Mr. Rowan says, and after some little experience of the same life I can confirm his remarks, that when the fur season was ended, he was quite sorry to say good-bye to the old smoke-stained camp that had been his home for nearly ten months, and on his return to civilisation he felt "as shy as a heaver," and often caught himself involuntarily looking on the streets for "tracks." One word more—and this last word to the fur countries applies to most of the wild countries we shall have yet to traverse—it is a mistaken idea that men lose sight of each other in the "wilds of America." I was never so much impressed with the smallness of the world as when I was a vagabond there. I was always coming across men in British Columbia or Oregon, whom I believed to be in Hudson's Bay and Manitoba. Years after I used to almost daily meet in the Strand, or in Regent Street, the friends whom I had bidden good-bye to at Fort Rupert or at Rogue River. The truth is, in an unpeopled country the men to be kept in view are few. In a great city, or in a thickly-peopled land, your next door neighbour is a stranger to you. Hence the seeming paradox.

CHAPTER XI.

THE DOMINION OF CANADA: ONTARIO; QUEBEC.

UP to the year 1867, Canada was at once a vague and a circumscribed term. It was vague in so far that the jurisdiction of the undefined territories of the Hudson's Bay Company was supposed to belong to it, while in reality the colony had little, if any, power in the fur countries. The name was strictly applied to the provinces of Ontario and Quebec, or in

JUNCTION OF THE RIVERS ST. LAWRENCE AND OTTAWA.

other words to Upper and Lower Canada. In 1840, they were united into one colony, though afterwards they separated, only, however, to become members of the confederation brought about in 1867. Gradually the Hudson Bay Territories came under the control of Canada, then British Columbia was added, then all the maritime colonies, with the exception of Newfoundland, until at the present time the whole of British North America—Newfoundland excepted—is classed under the name which heads this chapter. It was first explored—one might almost say discovered—by Jacques Cartier, in 1535. From 1608 to 1759 the country was ruled by the French. In that year, however, General Wolfe struck the first blow at Gallic dominion, and in 1763 Canada came under British rule. At that time it comprised part of what is now the United States, but in 1783 the sites of the after states of Minnesota, Wisconsin, Michigan, Ohio, Indiana, and Illinois, were surrendered to the young American

Republic. When, in 1867, the eastern portion of the country confederated under the title of the Dominion of Canada, while owing allegiance to the English crown, and receiving a Governor-General from the mother country, it became to all intents and purposes independent, and now governs itself by institutions mainly modelled on those of England. In a short time it has absorbed the other British colonies, and in the course of a few years we cannot doubt but that this young and vigorous offspring of Britain will rule all America north of the boundaries of the United States. The present provinces are Ontario,

WOLFE'S COVE, NEAR QUEBEC.

Quebec, Nova Scotia, New Brunswick, Prince Edward Island, Manitoba, British Columbia, and the great undefined North-West Territory, already described (p. 188), out of which has been formed the provisional districts of Assiniboine, Saskatchewan, Alberta, and Athabasca, the capital being Regina. Each of the provinces has its own Lieutenant-Governor, Law Courts, and Legislature, and each sends representatives to the Dominion Parliament, which meets in Ottawa, the capital. It has—the members being male British inhabitants between eighteen and sixty—more than 45,000 militia, and the nucleus of a navy. Its area is about 3,470,392 square miles, or only 430,000 miles less than that of the whole of Europe, and excluding Alaska, which should rightly belong to Canada, over 500,000 miles larger than the United States. The census of 1881 shows a population of 4,324,810, and it may now be estimated at 4,500,000. Ontario, in 1871, had increased in ten

years at the rate of 16·10 per cent., Quebec at the rate of 7·20, New Brunswick at 13·38, Nova Scotia at 17·21—or take the country as a whole, at the rate of 12·80 per cent., though in the last decennial period it was much greater. The area of the provinces and territory, as given in official documents, is as follows:—Nova Scotia, 20,907; New Brunswick, 27,174; Quebec, 188,688; Ontario, 101,733; Manitoba, 123,200; British Columbia (including Vancouver Island), 341,305; Prince Edward Island, 2,133; and the North-West Territory—much of which is useless for settlement—about 2,665,000 square miles. The population of the various provinces may be taken as follows:—Nova Scotia, 410,572; New Brunswick, 321,233; Quebec, 1,359,027; Ontario, 1,923,228; Manitoba (about) 65,954; British Columbia (estimated), 50,000, which, however, includes Indians, who are in the majority; North-West Territory, 56,446, an estimate which comprises the aborigines, who far outnumber the whites; and Prince Edward Island, 108,891. Forty-five religious and irreligious denominations are given in the census of 1871 as dividing amongst them the population of Canada. Though some 5,000 people claimed to be “without creed,” yet only twenty classed themselves avowedly as Atheists. Of these, nineteen were in Ontario, and one in Quebec. As the French population of Quebec is almost invariably Roman Catholic, it naturally follows that this religious body has the most numerous adherents in Canada. Next in point of numbers come the Methodists; then closely following on them the Presbyterians and Episcopalians. There were only about 1,200 Jews—a fact which, as in the corresponding case of Scotland, speaks either strongly for the gentleness of the other inhabitants, or the poverty of the country—and but 70,800 Quakers. The Swedenborgians number more than 3,000, the Universalists about a like number, while thirteen of the inhabitants of Ontario were, in 1871, Mohammedans. The origin of the population of the colonial offshoots of England is always curious to study. Accordingly, when we look at Canada from this point of view, we find that the Africans in Ontario were 12,097; in Quebec, 141; in New Brunswick, 1,638; and in Nova Scotia, 7,062. The Dutch in Ontario were 19,992; in Quebec, 798; in New Brunswick, 6,004; and in Nova Scotia, 2,868. The English now number in Ontario, 542,232; in Quebec, 81,866; in New Brunswick, 94,861; and in Nova Scotia, 131,383. The French were in Ontario, 102,743; in Quebec, 1,075,130; in New Brunswick, 56,635; and in Nova Scotia, 40,141. There were 210,577 Germans in Ontario, 8,409 in Quebec, 10,683 in New Brunswick, and 42,101 in Nova Scotia. Of Greeks there were 7 in Ontario, 7 in Quebec, 1 in New Brunswick, and 27 in Nova Scotia. There were 2 half-breeds in Ontario, but none are recorded from the other three provinces brought into this computation. These are, we presume, half-breed Indians. If so, the statistics are erroneous, for throughout Canada there are many such, though, we presume, they did not choose in the census so to describe themselves. In Manitoba a large number of the population are of this class, and in British Columbia and the North-West Territory; they are also numerous. The native Indians number in Ontario, 15,325; in Quebec, 7,515; in New Brunswick, 1,401; in Nova Scotia, 2,125; in Prince Edward Island, 281; in Manitoba and the North-West Territory, 55,239; and in British Columbia, 25,661. There were 8 Hindoos in Ontario, and 3 in Nova Scotia. The Irish were as usual numerous, though the greater portion of them are Ulster men, or Scoto-Irish, as they are usually called,

the bulk of the Irish emigration finding its way to the United States. From the Emerald Isle there were accordingly in Ontario, 627,262; in Quebec, 123,749; in New Brunswick, 101,284; and in Nova Scotia, 66,067. Italians usually love balmy breezes than those of Canada, but still they muster even in our North American territories, where they form a useful industrious class. There were, in 1871, in Ontario, 304; in Quebec, 539; in New Brunswick, 40; in Nova Scotia, 152. Russians and Poles numbered in the four provinces respectively, 392, 186, 1, and 28; the Scandinavians, 1,578, 648, 932, and 735, though of later years a small Icelandic immigration has to be added to these figures; the Scots, 378,536, 54,923, 49,829, and 146,027. The Spanish and Portuguese were 213, 142, 223, and 251 respectively in Ontario, Quebec, New Brunswick, and Nova Scotia. The Swiss were 2,382, 254, 41, and 1,860. The Welsh are included under "English," and the Dutch under "Germany." There were other nationalities represented, including 4,350 Chinese in British Columbia, 22 in Ontario, 7 in Quebec, and 4 in Manitoba among the Canadian people—a people which is being continually recruited from Europe, but has hitherto shown none of that tendency to die out when left to itself, which ethnologists declare is evident in the United States, where the native families are small in proportion to those of the foreigners.

The trade of Canada is rapidly on the increase. In 1867 the exports and imports, including those of Newfoundland, amounted to 139,202,615 dols.; and in 1883 those of Ontario, Quebec, New Brunswick, and Nova Scotia, had reached the potent figure of 221,678,743 dols., or almost doubled in sixteen years. The revenue for 1882-3 was 33,383,455 dols., while in 1867-8 it was only 13,637,928 dols. 49 cents. The expenditure in 1867-8 was 13,486,092 dols. 96 cents. In 1882-3 it was 27,067,103 dols. 58 cents. It ought, however, to be remarked that in the years 1872-3, there was a deficiency of 637,543 dols. 24 cents. The net debt of the Dominion in 1882, deducting assets, was 205,365,251 dols. The net debt thus amounts to 37.90 dols. per head, and the net interest to be paid 1.75 dols. per head. It ought to be remarked that of this debt of Canada not one cent was incurred by war or other worse than useless expenditure. It was all incurred for the construction of public works, of the greatest service to the country, which add to the revenue, and as the population increases, will still more be of value and profit to the young country. Among the most magnificent of these public works are the inter-colonial railway, the system of canals, and other works for communication across the Continent, such as the Canadian Pacific Railway, which is at the present date (1884) proceeding rapidly, and will not take more than two years—in the present aspect of affairs—to complete. As a further contribution to an estimate of the material prosperity of Canada, we may add that while in 1868 the paid-up capital of all the chartered banks of Canada compelled to make a return was 28,529,048 dols., and the deposits 30,168,536 dols., in 1882 they stood respectively at 60,103,394 and 118,089,316 dols. In 1882, there were in the Post Office Savings Banks, 10,442,051 dols.; in other Government Savings Banks, 12,295,000 dols.; and in the Montreal City and District Savings Bank, 6,371,271 dols. 24 cents. The combined Government and Bank circulation amounted, at the end of the fiscal year named, to 50,711,943 dols.

Having thus briefly sketched the general aspects of Canada, so far as figures admit of this being done, we may now, before describing the country in its general relations to the geographer and settler, make a few remarks on each province separately. These remarks, though necessarily

brief, are the result of a careful study of official documents, of much private correspondence, and of personal observations. The figures are the latest accessible, though in a few cases, where the recent census failed to supply data, these have been taken from one of a prior year.

ONTARIO.

In many respects Ontario is the best, as it is the wealthiest, and most thickly-populated of all the Canadian provinces. Its climate is mild enough to favour wheat and fruit-growing, and the great lakes in the vicinity, as well as the St. Lawrence, with its system of canals, enable its products to be carried far westward into the United States, and southward and eastward into the other provinces, as well as to sea, without being ever unshipped. The great expanse of water modifies the summer heats and the winter colds. Accordingly, Ontario is essentially a country of agriculturists. Of its area of more than 100,000 square miles—or about the same as that of Great Britain and Ireland—three-fourths are suitable for agriculture, though at present only about one-quarter is under tillage. Mr. Rowan, to whose account we owe most of our information, considers Ontario the best quarter of Canada for a farmer. As yet land is so plentiful that only the best portions of the country are seized upon for settlement. As it gets more “peopled up,” sections now despised will be occupied. At present there is no trouble in any of the provinces for a person of some capital to obtain a partially cleared and fenced farm, without being compelled to resort to the backwoods, and win a home from Nature for himself. The original settlers in Ontario were not, take them one with another, good farmers. They found the soil virgin, and when cleared of bush, capable of producing excellent crops of wheat. Wheat accordingly they grew, and grew season after season, until the soil was exhausted. They had no idea of rotation of crops, or if they had, they found it easier, and at that time cheaper, to exhaust the soil than to relieve it by less lucrative harvests, or were unable, when it was “worn out,” to put back again into it, by means of manure, the elements of which it had been robbed. Accordingly, they moved elsewhere to renew the same wasteful system. Thus their farms may be often had cheaply. These are no doubt for the time exhausted for wheat, but with the expenditure of a little money on manure, and care in growing other crops, they may be always brought back again into a high state of fertility.

In addition to the crops with which we are familiar in England, Ontario produces others which we usually associate with a semi-tropical climate. For instance, among her products the Lake province can boast wheat, oats, rye, barley, potatoes, turnips, peas, beans, clover, and grass, which grow side by side with maize, grapes, peaches, and pumpkins; tobacco also could be profitably cultivated.

The country is well adapted for stock raising, and accordingly Ontario sends large quantities of butchers' meat into New England, and to the Eastern provinces of the Dominion, where lumbering, ship-building, fishing, and such-like maritime pursuits so engross the attention of the inhabitants as to leave them little time for farming. Cheese is exported from Ontario to the extent of some two millions of dollars per annum, and fruit is grown very plentifully. Peaches, apricots, and nectarines ripen in the extreme south and west, and orchard crops and strawberries are grown on a large scale, as in all the large towns there seems an almost inexhaustible demand for this fruit.

Sweet and water melons ripen in every portion of Canada—not in the far countries proper—and in Lower Canada every garden possesses quantities of citron and musk melons of a size to which the forced fruit of that name could scarcely attain in England. The gooseberry does not, however, prosper in the provinces under description. Though agriculture is the chief occupation of Ontario, yet boating on the lakes and rivers, and lumbering in the forest, are engaged in by some of its inhabitants. Iron, silver, and copper mining also gives some employment, but the absence and consequent cost of coal will always be a great

VIEW ON LAKE ONTARIO.

drawback to this industry. Game abounds in the forests, and fish in the lakes. Toronto, the chief town, and the seat of the Provincial Government, has a population of nearly 87,000, and is a well-built, exceedingly pleasant "city," with good public buildings, and an excellent university, which, under good management, and the control of even a moderately intelligent minister of education, might become a seat of learning which would not only attract Canadians, but even the youth of the neighbouring United States. At present, however, it requires a thorough re-modelling both in its external and internal arrangements. Ottawa, the capital of the whole Dominion, is another of the Ontario towns. It has an increasing population of about 28,000. Before it was selected as the capital, on account of its central position, and its distance from the frontier, it was called Bytown. But since its elevation in the social

scale it has wonderfully progressed. The Government buildings are handsome, and finely situated on the summit of a rocky bank overlooking the river, affording a fine view on the one hand of the Ottawa River foaming through countless little wooded islands, dashing itself over the falls; on the other of a fine reach of the river which presents itself. All around, as far as the eye can reach—and this is a long way in the clear climate—is the great forest in its glory of colour and form. It is as yet a city in progress, but already there are signs that when it assumes form it will be a solid, substantial, and even handsome town. "Ottawa has some resemblance," writes Mr. Rowan, "to the country seat of a rich English nobleman, whose house is hospitably filled with pleasant people, while his park stretches far around him in the midst of a quiet rural landscape. But there is one great difference between the two. In an old country, side by side with immense wealth and excess of luxury, squalid poverty and extreme want are always to be seen. It is a significant fact that in Ottawa all the public buildings found in English cities exist, all but one—and that is the poor-house."

Man seized upon that beautiful work of Nature—the Chaudière Falls—and turned it into a ten million horse-power saw-mill. The beauty of the fall is much impaired, but it is a wonderful sight to see the logs drawn out of the water, by the water, into twenty different saw-mills. Each log is first squared by one saw, then cut into boards by another. The rough edges are not wasted. Circular saws whisking round with inconceivable rapidity rip them up into thinner boards. Even the edges are utilised, and made into laths by a very ingenious process; nothing is wasted but the sawdust. The town is very cleanly, every house being provided with a hose, with which the door-steps, pavements, and windows are watered and washed in dirty weather. The public conveyances are excellent, and even gaudy—"skeleton Lord Mayor's coaches" they have been called—which are greatly affected by the lumbermen when they come into town out of the backwoods for their periodical "spree." The petroleum wells of Lambton yielded 100 barrels of crude oil per day, and the wells of Upper Canada altogether over 10,000 barrels per week. The capital then employed in the trade was upwards of £2,000,000, and the oil region of Ontario is believed to be very extensive. Money is, however, dear—with good security bringing 6½ to 8 per cent.—so that this acts as an obstacle to the development of the resources of the country.

Land varies in price from 2s. to 40s. per acre, according to situation and soil, but Government lands—generally very far in the outer world—can be bought in Canada at an average of 4s. per acre, though even this is an unnecessary expenditure on the hardy immigrant's part, as the Government has certain regulations by which lands can be "pre-empted" without cost to the cultivator. But as a score of yellow-covered pamphlets describe the method in which this can be done, it is unnecessary to occupy space with it. In Ontario every head of a family is entitled to 200 acres of land, and every male arriving in the province when over eighteen years of age is entitled, on condition of settlement, to 100 acres of Government land free of payment. When we have to speak of emigration to Canada, we shall describe more fully the conditions demanded of the occupiers of these free grants. In Ontario, Quebec, New Brunswick, Nova Scotia, Prince Edward Island, and British Columbia, with the exception of a tract in the last-named province ceded for the purpose of the Pacific Railway, the lands are held by the several provincial governments.

In Manitoba and the North-West Territory, however, the land is still at the disposal of the Dominion authorities, who give a free grant of 160 acres to every settler on condition of three years' residence, and the payment of a small entry fee.

QUEBEC.

This old home of the French *habitants*—the polite old Seigneurs, who live under their old laws under a strange sovereign, and while different in manners, thoughts, and religion from the rest of their fellow-subjects are yet loyal British subjects—is a province scarcely so valuable to the agriculturist as Ontario. It has an area of 200,000,000 acres of land, much of which is fertile and capable of cultivation. The climate is, moreover, even better than that of Ontario. All the ordinary cereals and grasses grow to perfection, while Indian corn is one of the most common crops. Tomatoes also grow to perfection, and it may be mentioned, for the sake of comparison, that in no part of the United Kingdom will either of the two latter crops ripen in the open air. Its great forests also supply much of the "lumber" of Canada, and though it has no coal, yet the great supplies of peat aid in supplying the place of the former. The fisheries are of immense extent, and very valuable. They supply a great material of export, and breed up a hardy race of seamen. The cod-fishery of the Lower St. Lawrence employs a number of small schooners, and a good deal of fishing is also done in open boats. A fishing village on the shore of the St. Lawrence has a peculiar appearance from the cod-drying platforms or stages, which look like great ladders, "lying side by side in a horizontal position, some three feet from the ground. These platforms are covered with layers of green boughs, on the top of which the fish, when split and salted, are spread to dry in the sun. In the front of each cottage, where one expects to see a garden, there is instead one of these stages, redolent of cod-fish." Each boat, manned by two men, will take in the course of a year about 10,000 cod. Yet the fishermen are generally poor, the "tally system" being here as elsewhere the ruin of the labourer, while the employer grows rich on it. The Jersey merchants are the chief buyers, and there being scarcely any competition, the buyer puts his own price on the fish, and finds it to his interest to keep the improvident fishermen in his debt. The result is that the men are little better than bondsmen of the buyers, being in debt to them for their boats, fishing-tackle, and even their clothes and provisions, and sometimes even for their houses and potato gardens. The great River Lawrence runs through this province from the head of ocean navigation to the gulf of the same name, thus giving the country a most commanding commercial position. The scenery on the banks is always pleasing, and sometimes even magnificently grand, especially among the thousand islands. The climate is very healthy, the winter being cold and the summer of about the same average warmth as that of France. The dryness of the winter air renders the frequent extreme cold of that season not nearly so unpleasant as it would otherwise be, while the snowfall is even welcomed by the farmer as forming a warm covering for the ground, and enabling him to drag his firewood and other "produce" to market with ease on sleds. On the other hand, while the climate is in winter not more severe than that of some of the Western Prairie States in America, the summers are freer from ague, which is the scourge of most parts of the American continent below a certain latitude. Quebec and Montreal, both old French towns, and still maintaining a good deal of that Old World appearance which is so rare in America, are the chief cities of

the province. The first, which has a population of 63,000, is the capital of the province, while the latter, with a population of 150,000, is the commercial metropolis, and, indeed, the chief port in British North America. To travellers from Europe, Quebec will always have the greatest interest. It has historic associations which few of the other Canadian towns possess, and the man must be deficient in sentiment who can visit the heights of Abraham, or walk under the shadow of its citadel, without memories that take him far back to the days when the Briton and the Frenchman fought here for the mastery of the New World. Quebec is essentially a French city of two hundred years ago. The further one travels west in America, as Mr. Rowan remarks, the more American do the cities become. The new mushroom towns are

CHAMPLAIN'S FORTIFIED CAMP: THE FIRST HOUSE ERECTED IN QUEBEC.

redolent of the soil; they were founded, named, and peopled by the new nation which has taken root in the land. On the other hand, the old ones are the work of men who carried to them the thoughts and the skill of the old old world beyond the sea. St. John's, Newfoundland, the most easterly of them, looks like some Irish town, the dirty irregular streets and neglected *trottoirs* having an only too distinctly Milesian aspect. Here is the British policeman, and his prey, the Old World beggar, while the stray pig, which wanders about seemingly quite at home, brings into the mind of the newly-arrived visitor a flood of recollections of the Green Isle. "From the flagstaff of the city," writes one of the most observing of its visitors, "a spot to which every newly-arrived immigrant or tourist naturally turns his steps, a magnificent panorama presents itself to the eyes. The old city nestles close under the guns of the citadel, as if for protection. A dozen steamers lie at the wharf close under the ramparts, and the sightseer can look down upon the decks of forty or fifty large sailing ships lying at anchor in the stream. Opposite is Point Levis, with its acres and acres of floating-lumber, and its high lands, which, in the old wars, were out of range of the citadel guns, but which in these days of improved ordnance could be commanded by them. But up the river and down the river, what

VIEW OF QUEBEC.

glorious views! what an expanse of blue water and glorious sky! what masses of rock and forests, with the rugged and sharply-defined Laurentide mountains in the background, rising apparently sheer out of the water! There are not many cities in the world so favoured. But every one to his taste. Yankees look on 'Queēbee,' as they call it, as a miserable place, a 'finished city,' a place that does not go ahead. It is, in fact, an Old World city, and as such inexpressibly refreshing to the Old World tourist, whose eye is wearied of the level uniformity and terribly regular rectangular cities of the West. It is devoutly to be wished that no improving Lord Mayor or energetic municipal council will ever try to adapt Quebec to the scaled pattern of American cities. But even if they did their worst, I fancy that Nature would thwart them. The old war-worn ramparts of the citadel are crumbling away; peace bears harder upon them than war. One cannot help thinking that the richest country in the world might well afford to keep such a fortress in repair. . . . There is no city in the New World that has a more interesting history of its own than Quebec. A monument to the memory of Wolfe and Montcalm reminds the visitor of a passage in their history. On one side is inscribed 'Wolfe,' on the other 'Montcalm.' Nothing more; but what a glorious junction of names, equal honour alike to victor and vanquished!"

Montreal is also an extremely interesting city. But there the tide of life moves more rapidly, and the signs of the old French times are fast disappearing under the influence of modern progress. Here and there a quaint old building, a street which reminds one of pre-Hausmann Paris, and the endless French names, are now the chief features which remind the visitor that here he is treading a city of *La Nouvelle France*. The island of Montreal is really a garden, and between Montreal and Quebec there are fertile districts richly cultivated, and containing many prosperous settlements. Below Quebec the soil is poorer, the people and the seasons shorter. The wooded lands—especially if covered with hard wood timber—make good farms when cleared; but then, though easily cleared, they are not so desirable as those which comprise timbered upland and "intervale," or meadows which yearly yield excellent crops of hay, without any further labour—a matter of great importance in a country like Canada, where the winters are long. In Quebec district the backwood settler may be probably seen to better advantage than in most other parts of Canada. His "clearing," and first attempt to found a home for himself, must to the thoughtful traveller be objects of exceeding interest. "If approached," writes Mr. Rowan—and I quote this on the whole the most authoritative writer on Canada, as expressing what strikes me as a most graphic picture of the difficulties of a pioneer of civilisation, in the words of one who gained his knowledge first hand, which the author cannot pretend in this case to do—"from the side of a forest, the first sign of civilisation is the sound of the cow-bells, which are strapped to the necks of the cattle to enable their owners to find them. A good-toned bell, on a still day, can be heard two or three miles off. The roads leading out of these back settlements are of the very roughest description in the summer, but in winter, thanks to the snow, are level and excellent. Of course, as the settlement improves, the roads improve, and in a very few years the back-settler's home of to-day is in the centre of the settlement, accessible by good roads, and possessing every advantage. For the first seven or eight years the back-settler leads a hard life. Having chosen his land, and purchased it (one-fifth of the purchase-money being paid

down, and the remainder in four annual instalments), he proceeds to build himself a log house, about 18 feet by 20 feet, which he roofs with split pine or cedar ('shingles'). Externally, these log huts are of the roughest description, no tool being laid upon them but the axe. Internally, however, when the good woman is tidy, they are comfortable enough. The back-settler, though content with a log hut himself, puts up a more pretentious building for his hay and his cattle. His barn is generally built of boards hauled from the nearest saw-mill, and roofed either with shingles made by his own hands, or with spruce bark. These buildings are situated in the centre of an open space in the forest, from which it is fenced off by the half-burnt poles, arranged in what is commonly called a 'ripgut' fence. The crops—potatoes, oats, and buckwheat—grow in patches amongst the black charred stumps, and grow so well, too, as almost to hide the latter, though they are two feet in height. Outside the fence the back-settler's stock remain about the neighbouring forest, where I am afraid most of his leisure time is taken up in hunting for them. But, indeed, his leisure moments must be few, for a back-settler has to turn his hand to everything. He must be his own carpenter, his own blacksmith, &c. &c. There is no division of labour in the backwoods. The man and woman of the house do everything. The knowing old settler never breaks his back in tearing a green stump out by the roots. His *modus operandi* is somewhat as follows:—In winter, when he has the time to spare, he chops a few acres of forest, hauling off the soft wood for logs, fence rails, &c., and the hard wood for firing. The waste wood and branches he makes into piles, and burns, when dry, in the spring. In the space thus cleared and burnt, he plants potatoes with the hoe, here and there, in little hills among the stumps. In the following year he sows grain-seed, and lays it down as pasture. After seven years the hard wood stumps are rotten, and come out easily. The pine, owing to its resinous nature, does not rot so quickly, and gives a little more trouble. The land is now ready for the plough, and in the eighth year he takes a crop of wheat off it, and brings it into regular rotation. Say four acres of forest are chopped every year, he will thus have (after the seventh year) ten acres of new land coming in each season, viz., five of burnt land for potatoes, and five to stump and plough for wheat. The virgin soil needs no manure, and yields magnificent crops. When the settler has new land coming in each year, he, from time to time, lays down portions of his longest cleared land in permanent pasture." His life is not all roses; and, indeed, the roses are something he lives to enjoy in the future. The venomous flies, and the mosquitoes, next to the "woful lack of cash," are his greatest trouble. But even then he has his consolation, for the greater his clearing becomes, the less do these pests annoy him; they disappear with the forest. In the high lands they are not so bad, but in swampy ground they are all but intolerable. In the valley of the Metapedia, the writer whom I have just quoted mentions that he has known families absolutely routed out of the country by the black flies. The cattle are also not exempt. The caribou fly, "whose bite is only a shade less severe than that of a dog," greatly annoys them, until, to obtain relief, they imitate the moose by plunging into the lakes and rivers, and there remaining during the hot portion of the June and July days. But the backwoods have their compensating advantage. In the winter the settler is sheltered from the blasts, and he has always fuel at his hand to warm himself to his heart's content. His life is

one of toil, but it is one of hope also. Every day he devotes to labour brings him a day nearer to his goal of independence. "Every hour's work he spends on his clearing makes him a richer man, every acre he ploughs, every stump even he takes out, makes his farm more valuable. All his work bears fruit, and at the end of ten or fifteen years it is wonderful to see what a transformation the industrious back-settler has made in the hole

THE MONUMENT TO WOLFE AT QUEBEC.

he has hewn out of the primeval forest." The rude log hut in time gives place to a more elegant and commodious mansion. Nothing is more common than to see on the farm of a successful settler a handsome house, and a little way off the rude little log cabin which, in "old times," gave him and his family shelter. And I may add, nothing is more common than to hear the substantial farmer in Canada or the United States talking almost regretfully of the happy days he spent in the old cabin, when he was poor in gold, but rich in hopes, and in all that makes life tolerable.

COD-FISHING ON THE GREAT BANK OF NEWFOUNDLAND.

Land in Quebec—or Lower Canada, or Canada East, as the people still familiarly call it—can be bought at prices varying from 15d. to 2s. 5½d. per acre, payable by five instalments, one of which is due on the day of purchase. Indeed, this price is equivalent to giving away the wild lands, for the sum exacted in the form of payment will really hardly pay the cost of surveying and making roads. In the valley of the Saguenay is much good land. The valleys of the Matawan, Metapédic, and Ottawa may also be specified as districts in which the intending agriculturist can secure a settlement. Most of the places are tolerably remote from

MONTREAL, FROM THE ST. LAWRENCE.

the old settlements, for it is almost unnecessary to say that the best land is not the kind which remains longest unoccupied. However, remoteness becomes soon a comparative term. Roads and railways are rapidly made, and the settler, who a few years ago was in the woods, finds himself near to a rising town, and on the line of a railway which skirts his farm. In Quebec province there is what is called the "homestead land," which first originated in the United States, and is now found in most parts of the country. This is under the protection of a law by which a certain portion of the settler's property is exempted from seizure for debt for ten years after he settles on his land. The law is an excellent one when so framed—as I believe it generally is—to grant necessary protection to the enterprising settler without at the same time destroying his credit. It has, however, this disadvantage, that it often is only a cloak for

a swindling settler snapping his fingers at his just creditors, and in this respect is the antipodes of the English law of distraint, and the now obsolete Scottish one of "hypothec."

In Quebec, though the greater number of the people are French, yet both the English and French languages are spoken. Canada, indeed, presents the spectacle of more than one million Frenchmen—or people of Gallic descent—living quietly and contentedly under British rule. But it must be remembered that these are not Frenchmen of to-day or even of the last generation. To them all Republics—first, second, and third—are equally unknown. The second Empire they know as little of as the first. In a word, they are Frenchmen of the *ancien régime*—of the old monarchy—and to-day they speak a dialect which their fathers spoke in the time of Louis Quatorze. They have, therefore, only a sentimental feeling for France. Few of them ever saw the fair land, and, above all, they know when they are well off. They are protected in their religion by the Government. They have their own schools, and their own priests, and live under a primitive sacerdotal rule, which appears strangely out of place in the New World, but which is mightily convenient for a lazy politician who wishes a seat without the nuisance of having to canvass in person the votes of his constituency. It must, however, be acknowledged, that on the whole the priests vote for their flocks in the best possible manner, and perhaps even better than the latter could do through their individual units. To the French-Canadian Canada is all in all. He may emigrate to the United States in search of high wages, but he rarely settles there; just as the Frenchman of old France always longs, when he has made a few thousand francs, to return again to his own sunny native land. But it is the same with all the people of the Dominion.

In 1873, 9,000 Canadians returned from "the States," to again settle in the provinces they had left, and to a greater or less degree the same migration is yearly going on.

In 1759, when they passed under British rule, the French numbered 65,000. At present their descendants, by the census of 1881, are 1,299,161, and as the changes in France have held out inducements to the inhabitants of Alsace and Lorraine to emigrate, it is possible that the population of Quebec will be reinforced by a considerable contingent from the annexed provinces. As the darker side of the bright picture of the Frenchman under British rule, it must be acknowledged that they are excessively ignorant, and that the priests exercise an iron rule in controlling education, and in levying the tithes and other Church dues from its adherents. Quebec accordingly preserves the last remnant of a State Church in America, and some of its sees and conventual institutions are extremely wealthy. The French in Canada also live under their own laws, except in those cases in which they have preferred to substitute the English criminal law and trial by jury for the old arbitrary rule of "intendants," and such like representations of the despotic French monarchy which existed prior to the Revolution of 1792. In Quebec, it may be added, are found the greatest number of owners and occupiers of land under ten acres, and under the influence of old custom, and the French law of inheritance, a continual subdivision of new heritages is going on among the members of a family. The effect of this is pointed out in the remarks of a correspondent regarding Lower Canada. He observes, that for some distance below the city of Quebec, and between that place and Montreal, on

either side of the St. Lawrence, but more especially on the south, a stranger cannot fail to be struck with the number of small homesteads scattered all along, giving almost the appearance of a village street. This arises from the old French law and custom of dividing the property, on the death of the father, equally amongst all the children; the consequence being that, in the course of a few generations, a large farm becomes cut up into a number of homesteads, each scarcely capable of supporting the family residing upon it, and too small to admit of further severance. The *habitant*, or French-Canadian farmer, knows no love stronger than that for his home. The place where he was born, though affording a slender livelihood, is dearer to him than all the world. In vain for him has the magnificent West been opened up—his dreams hover round his own fireside and his church; he asks no better lot than to live where his father lived, and to die where his father died. Happy in his simplicity, he copies no man's improvements, and imitates no person's mode of living. His life, his food, his enjoyments are all regulated by the opportunities of the day. Politeness is a trait, moreover, native to his character. You may enter a *habitant's* house—always clean, with flowers in the window, and walls well whitewashed—and though the man may be the poorest in the parish, you will be received with so much ease and frankness that you can with difficulty believe such people have always lived in such a place. You may speak execrable French—many English people unfortunately do—and make mistakes that would excite the risibility of a saint, yet you never see a smile on the face of the *habitant*, nor even on the faces of his children. Of course, after you go away, they enjoy the fun amazingly. Your religion, your politics, or your country may, from accidental circumstances, be distasteful to him, yet as long as you are under his roof, you never hear a word that could hurt your feelings. In enterpriso, in boldness of thought and action, the *habitant* is far behind the rest of America; in opposing the introduction of new improvements and inventions, he is behind the age; but in politeness and good breeding he is immeasurably above any similar class on this continent. Up to 1854 the seigniorial tenures of old France prevailed, and their influence is still so far felt that in Quebec holders of more than 200 acres are also more common than in the other provinces.

CHAPTER XII.

THE DOMINION OF CANADA: NEW BRUNSWICK; NOVA SCOTIA; PRINCE EDWARD ISLAND;
NEWFOUNDLAND; MANITOBA; BRITISH COLUMBIA.

THE province of New Brunswick has a population of 321,233, and an area of 20,000,000 acres, or deducting St. John, the capital, about one person to every hundred acres. It is 210 miles long and 180 broad. It has a coast-line of about 500 miles, indented with numerous bays and inlets, and is intersected in every direction by large navigable rivers. It is thus larger than Belgium and Holland united, and about two-thirds as large as England. Generally it

is a flat and undulating country; on its north-east coast, from the Bay Chaleur to the Nova Scotia boundary—200 miles—scarcely a hill 300 feet high existing. Skirting the Bay of Fundy and the St. John River there are some elevated lands, but the only mountains worthy of the name are those bordering the province of Quebec, where oval-topped hills range, according to a Government report before us, from 500 to 800 feet in height, clothed with lofty forest trees almost to the summit, and surrounded by fertile valley and table land. The country is healthy in the extreme—the ranges of climate being in the interior from 92° above zero to 18° below it—but the days during which the thermometer falls below zero are rarely more than thirty. In April snow disappears, and in June the apple trees are in full blossom. In August early potatoes are brought to market, but it is not until September that cereals are ready to be cut. The autumn is, however, a long and pleasant season in New Brunswick. In November there is usually very wet weather. By the end of the month the rivers are closed, and by the middle of December a Canadian winter has fairly set in. It would, however, be a mistake to say that it is a farming country; little or no emigration goes in the direction of this province. Nine-tenths of it are still forest; hence “lumbering” is one of the chief industries of the country. Probably this fact, much more than the unfavourable character of the country itself, is the reason why farming is not more pursued. It is not their policy to follow a laborious calling at which money is made slowly when occupations involving no doubt greater risks, but at the same time quicker returns, offer attraction to the hardy colonists. Accordingly, lumbering and ship-building—though the introduction of iron ships has unfavourably affected this occupation—command the attention of the greater part of the population. As railways are now spreading over the province other industries are springing up, and in time farming—even though its operations have to be compressed into six or seven months—will also be more extensively followed than it is at present. Its navigable rivers are an important feature in the future of New Brunswick. The St. John, which is 450 miles in length, is the chief one (p. 232). It is navigable for large steamers to Fredericton, eighty-four miles from the sea, and in high water 120 miles further, while the Miramichi is navigable for vessels of 1,000 tons for twenty-five miles from its mouth, and for schooners twenty miles further up. The Restigouche is also a fine river, three miles wide at the point where it falls into the Bay Chaleur, and navigable for large vessels eighteen miles from its mouth. The beauty of the New Brunswick forests is celebrated even in America, though the trees are inferior in size to those on the Pacific coast; but the variety of trees found in the former adds charms to them which the sombre woods of British Columbia so greatly want. Brilliant scarlet and violet, and every shade of blue, brown, crimson, and yellow may be seen in these forests, as the foliage changes with the advancing season. Wherever the sunlight can penetrate, or the country is divested of wood, the beautiful flora of Canada is seen—*Lilium canadense*, which stretches to the Pacific, and is now naturalised in our gardens, the *Ledum*, the *Pyrola*, the *Potentilla*, and other familiar flowers (p. 228).

The fisheries are valuable, while there are also minerals, bituminous coal and excellent freestone included, in some quantities, though we fear hardly yet of sufficient value to

FLOWERS OF CANADA.

make mining a profitable business. Manufactories of woollen and cotton goods, boots and shoes, furniture, doors, sashes, staves, &c. &c., are also in progress, though the shipping interest of New Brunswick, which, with that of Nova Scotia, has made Canada the fourth maritime

power in the world, exceeds all others in importance. St. John is the most important town commercially, but Fredericton is the pleasantest. It is the residence of the Lieutenant-Governor, and the place of meeting of the Legislature, and is charmingly situated on the banks of the St. John. Driving, riding, canoeing, skating, sleighing, and "traboging" form some of the common amusements of the inhabitants. The people are what is called in America "sociable," as might be expected in a robust, athletic, active, intelligent population. They have even less than the interior Canadians any exclusiveness or suspicion of the stranger. Emigrants do not come to them in great numbers. They have not been often deceived in new friends, but being very familiar with new faces, owing to their proximity to the seaboard, they form rather a pleasant set of people, among whom the visitors from the "old country" or the intending settler can sojourn with much satisfaction. As canoe-men and boatmen the New Brunswickers are famous; as anglers they are scarcely less noted. The rivers all abound in fish. Salmon are plentiful, while the "lake shiner" (*Salmo Glosseus*) is a trout perhaps peculiar to the country. The striped bass (*Morone saxatilis*) is another well-known fish of the New Brunswick rivers. It may be freely caught with bait, but spearing is the favourite mode of capture. The sturgeon (*Acipenser oxyrinchus*) measures from six to twelve feet in length, but is not caught by the settlers, though, whether for profit or sport, its capture by spearing should have charms for the Brunswicker enamoured of either motive to exertion. Eels are also plentiful in all the rivers, but, like the Scots, the people of the province have a strange prejudice against them, founded on their supposed resemblance to snakes. Cod, mackerel, herring, and shad may be mentioned among the sea fisheries prosecuted off the shores of New Brunswick; for as a branch of trade the fresh-water fisheries are almost entirely neglected.

To the sportsman the country affords many attractions. To those who know where to go, and how to go about, good sporting may be easily got; while the stranger may always find good guides among the Micmac Indians who live on the St. John River. Moose are now very scarce, owing to their being recklessly slaughtered for their hides; but caribou are plentiful in the spruce woods, interspersed with "barrens," old burnt woods, and patches of hard woods, such as the centre of the province from the Bay of Chaleur to the Grand Lake. Other deer and bears are plentiful in the more inaccessible places. Beaver are met with, but fur animals, except otters, muskrat, and lynx, are rare.

Snipe and cock shooting can be had in the latter end of September and October, while partridges are abundant. But the Canadian bird, unlike the English one, instead of being flushed in the stubble, takes to trees. The "partridge gunner," as he is called, may be seen in the autumn leisurely driving his wagon along an unfrequented road, while his dog ranges the neighbouring bush, and when it flushes a bird, "sets" at the bottom of the tree to which it has taken until its master arrives, to first knock its head off with his rifle, and next to fight for its remains with his setter. The partridge of Canada is, however, in reality, a grouse. There are two kinds, the "birch-partridge" (*Tetrao umbellatus*), and a scarcer and hardly so delicate species, from a culinary point of view, the "spruce partridge" (*T. canadensis*). Woodcocks, and wild geese of many species, are also abundant during the winter, while fair sport may be had along all the North Coast on the Nova Scotian side; but is not all this, and more, written in the book of Leith Adams?

NOVA SCOTIA.

This is perhaps the best known of all the Canadian provinces, from the fact of its having been long a British military and naval station. The province contains about 11,000,000 acres, of which one-fifth consists of lakes and small rivers, and of this area less than half is fit for tillage. The scenery is very diversified with hills, dales, quiet lakes, and little land-locked inlets of the sea (p. 236). Yet both the country and its resources are little known, simply owing to the fact that most visitors only see the vicinity of Halifax, which is by no means a favourable specimen of the province. The climate, owing to the tempering influence of the sea breezes, is the mildest of any portion of Eastern Canada—the mean for the year being about 43°—and is correspondingly healthy, a fact which may account for the province having fewer medical men in proportion to its population than any other portion of Canada. It is not a good agricultural province, but nevertheless the farmers are numerous, prosperous, and enterprising, and the fisheries are also profitable. So valuable are the latter that the encroachment of the American on them is an oft-recurring subject of dispute between the Government of the United States and of this country. They consist of herring, mackerel, cod, haddock, halibut, hake, pollock, shad, smelt, perch, eels, and lobsters, which latter are usually sold in the Halifax market at about one shilling per dozen. Numbers are, however, being sent in a “tinned” state to Europe, so that these halcyon days for Halifax lobster eaters cannot long continue. Spearing lobsters by torchlight is one of the “sports” of the country, while salmon and trout are abundant in the rivers and lakes. Timber—pine, spruce, hemlock, and hardwood—is exported to an immense extent, while the sap, which may be obtained by tapping the tree in spring, collecting the juice and boiling it down, is extensively made into sugar and syrup for home consumption—the traditional “short sweetening” and “long sweetening” of many a familiar tale. Game is also abundant, but the mines of coal (21) and iron are much more important. Gold also is mined in about sixty different places, where the quartz is crushed and the precious metal extracted in sufficient quantity to make the business a paying concern, though in California the rock would hardly pay the cost of working. The exports of the province amounted in 1881 to £1,740,317, while the imports were £1,843,455 in value. Its census then showed 440,572 people, of whom 19,000 were employed in the fisheries, which were exported to the value of 4,437,364 dols. Social life in Halifax is very pleasant, the people are refined and respectable in the extreme, as the many navy and military officers who have been stationed there and married daughters of the land can abundantly testify (p. 233).

Cape Breton, which the Duke of Newcastle—George the Third's minister—was so astonished to find was an island, constitutes the highlands of Nova Scotia, and curiously enough was originally settled by Scottish highlanders. Its scenery is fine. “The hills fall somewhat short of mountains, but they rise boldly from the water's edge, and are clothed to the summit with beech, maple, and birch, the bright green of the deciduous trees being relieved by the dark green—almost black—of the fir tribe, which grow in sombre masses in the ravines and ‘gullehes,’ forming an effective setting to the hills.” The island is settled by two classes—the Acadian-French, who are fishermen, and the Scots, who are chiefly cattle graziers. The latter, even to the third generation, still speak Gaelic;

and though a fine, hardy, good-looking race, are but inefficient farmers, who have not got thoroughly assimilated to the changed condition of life here compared with that which they left behind in Scotland. The French have still all the characteristics of their ancestors, the "Acadians," who originally settled it.* Sable Island is another of the outlying dependencies of Nova Scotia. It is twenty-five miles in length, by about one and a quarter in width, and is formed of grass-covered sand-hills, on which herds of wild horses, known as Sable Island

FALLS OF THE ST. JOHN RIVER, NEW BRUNSWICK.

ponies, pasture. Nova Scotia took its present name in 1621, prior to which date it was known as Acadie, Frenchmen having first colonised the island in 1604.

PRINCE EDWARD ISLAND.

This is one of the smallest, but most beautiful and fertile portions of the Canadian Dominion, yet it is at the same time one of the most backward. The Isle of St. John—its first name—which was dignified with its present title in honour of the Duke of Kent, her Majesty's father, was ceded by the French to George III. in 1763.

The country was then distributed among the hangers-on of the Court, on the simple

* Brown's "History of the Island of Cape Breton" (1869).

conditions of the grantees paying a quit rent to the Crown, and of the proprietors sending out German Protestants to these lands in the proportion of at least two hundred to each of the original sixty-seven townships. With the exception of Lord Selkirk none of the grantees ever attempted to fulfil the conditions on which they had obtained their land. Even this energetic Scottish nobleman, whose name, and that of his descendant, are so linked with the history of British North America, did not fulfil either the spirit or the letter, for he introduced, not German, but Scottish immigrants. The rest of the proprietors

VIEW OF HALIFAX, NOVA SCOTIA.

were, with few exceptions, absentees, who neither lived on their lands, attempted to people them, nor spent money in improving them. Meantime the original Acadian-French, who had been in the country prior to its cession to England, remained on the land, much to the annoyance of the new proprietors, who found no small difficulty in either removing the squatters or getting them to pay rent. In every respect this feudal system of land tenure, so opposed to the ideas of the New World, worked badly. The resident agents of the proprietors allowed the rents to fall into arrears to an endless extent, while litigious squatters were ever and anon defying the rights of the descendants of those to whom the island had been granted by young King George. No doubt many of the farms were let on merely nominal terms—such as at rents, or rather what are called in Scotland “feus”—varying from about 6d. to 1s. per acre, on leases of 999 years. But the grievance,

though a sentimental one, was, nevertheless, in a country where every man aspires to be his own landlord, in the eyes of the Acadians so substantial, that rather than endure it any longer the settlers in many cases emigrated to where they could obtain lands on their terms elsewhere prevalent in America. The Colonial Government tried as far as possible to mitigate the mischief by buying up the lands from the proprietors, and then reselling them to the settlers. But this only partially met the demerits of the case, for the grantees' descendants cherished as warmly the privileges of being landlords as the colonists spurned the idea of being tenants. Finally, the Dominion of Canada induced Prince Edward Island to enter the Union by buying up, at a valuation, and by a Compulsory Act, the rights of the proprietors. For this purpose 800,000 dols. were voted, and the arbitrators appointed for the purpose adjudged to the proprietors sums varying from 4s. to £1 per acre in payment of their claims. The remedy was an heroic one, and was not administered without inflicting injury on the island proprietors. But it was the only available one; and at one swoop feudalism was banished from the New World. This drag has, however, had its effect on Prince Edward Isle, in so far that its progress has been more backward than that of the other Canadian provinces. Another cause is its isolation. Situated at the mouth of the Gulf of St. Lawrence, it is communicable only by steamer in the summer, and during the winter is often more or less shut off from the mainland by ice. This ice, moreover, owing to the strong current, does not form a solid bridge, but is "continually moving and shaping itself into walls and barriers, which greatly obstruct navigation. Mails cross these straits with a certain amount of regularity during winter, but passengers only do so when compelled by necessity. The vehicles used for this service are very light boats, sheathed with tin and fitted with sledge-runners. They are dragged along the uneven surface of the ice by straps, which are fastened to the gunwale of the boat. Each man passes one of these straps round the shoulders for safety. Occasionally patches of open waters of great or less extent occur, when the men jump in and row. Now other barriers of broken ice as high as housetops have to be surmounted; but worst of all 'lolly' has to be crossed. 'Lolly' is a description of soft ice, which is too soft to walk over, and too substantial to work a boat through. I can only compare it to that soft, green, and oozy place in a bog or swamp, with which most snipe-shooters are familiar, in which the novice flounders up to his armpits, and which requires a cat-like and rapid step to cross. Carrying the mails across these straits is, therefore, an arduous and perilous service! It is rarely done, though the distance is only eight miles, under four hours of hard toil, and often takes ten or twelve hours. The boatmen are such admirable judges of ice and of weather, that fatal accidents rarely occur, and when it is considered that the mercury is sometimes 10° or 20° below zero during these crossings, it cannot be wondered at that Jack Frost sometimes seizes hold of a toe, an ear, or a nose. To drive him away the part has to be rubbed with snow, or if the toe be affected, a little brandy poured into the boot." Railways are now being made in the provinces, but Mr. Rowan, from whose account of the island we derive most of our information about it, was not, at least in the earlier days of them, enamoured of the Prince Edward "roads." The railway was a bribe to Prince Edward Island to cast in her lot with the Dominion. In a word, to use a familiar Canadian term—and its familiarity shows its frequent occurrence—the island

was "railwayed" into confederation, by a process which is now being applied to Newfoundland, and the hitch in the working of which, in regard to British Columbia, has been the cause of no little trouble to that far province, now lying so lovingly in the bosom of the Dominion. "The process of 'railwaying' a province into confederation is briefly this:—Send agents into the coveted province to raise an agitation for a railroad; 'square' the Press, and foster the agitation by every possible means. Get a Railway Bill passed in the Local Legislature, keeping the cost quietly in the background. This can be accomplished by liberal promises, a few substantial gifts, and an order or two of St. Michael and St. George. Money seems plentiful at first, and the railway progresses. Everything goes smoothly, until one morning the province finds it has plunged itself deeply into debt. This debt is made the most of, popular alarm is fanned, and the frightened province, to avoid supposed bankruptcy, throws itself into the arms of its absorbing neighbour. And the worst of it is that in these railways, got up for political ends, there is no small amount of 'axe-grinding' and 'log-rolling.' Contracts are given in such a way as to put money into the pockets of political partisans, and not with regard to the best interests of the country. The Prince Edward Island Railway meanders through the island like a stream through the meadows. It was probably contracted for by the mile, so the more miles the merrier the contractor. Not only did he escape the hills, but by following rivers up to their sources, he escaped bridging. The fences are neither ornamental nor useful, and cattle treat them with contempt. It is possible that I took a prejudiced view of this railway. I only travelled it once, and then I was two hours and a half late in a journey of forty miles. The delay was accounted for to the satisfaction of my fellow passengers, who were merely having 'a ride on the ear' for amusement. In the first place a herd of cattle belonging to a personal friend of the engine-driver, notwithstanding the frantic screams of the whistle, persisted in remaining on the track until the functionary before named, assisted by the conductor and some passengers, got off and drove them home. Then at a wayside station a picnic party, consisting of almost twenty young people, got in, and were altogether too much for one locomotive, as my friend the driver (who spent a good deal of his time in cruising up and down the line) remarked, 'She was kind of balky at the hills.'"

The island is about 130 miles in length, and at its widest point thirty-five miles, but the deep indentations of its coast line in some places approximate the two opposite shores to within three or four miles of each other; so that there is no part of the island where the farmers are beyond convenient reach of a harbour. Farming prospers, and though isolation has its disadvantages, it has its advantages also. The island escapes commercial panics, and as yet the potato, the grasshopper, the Colorado or potato beetle, the army worm, and the rest of the exceeding great host of agricultural pests in America are altogether or nearly unknown. The soil is good and easily cultivated, and the climate healthy and invigorating. The air seems to infuse new life into visitors, and to be a prophylactic against all ills to the robust, ruddy-faced islanders. The winters are not so cold as those of the mainland, nor the summers so warm, yet the Atlantic fogs do not reach its happy shores. The soil being an alluvial deposit of St. Lawrence, stones are unknown in it. The roads in summer and winter

are admirable, but in spring and autumn necessarily detestable. During the latter season, they are composed of a bed of soft sticky mud, and they are mended by being simply ploughed and harrowed! To macadamise them stones must be brought over from the mainland, or else they might be paved with baked bricks or clinkers, like the roads of Holland, which is made up of Rhine mud. Charlotte Town is the capital, and the market house, the island club, where not only are bargains made, but gossip exchanged. The Local Government keep up a stock farm near the capital for the purpose of im-

VIEW IN NOVA SCOTIA.

proving the breed of cattle, for which purpose good blood is imported from England and other raising countries. The province is famed for its trotting-horses, with wondrous wind and iron constitutions. Winter is the great time for practising the nags. Some of the jockeys sit behind their trotters in light sleighs, others in ordinary ones, while some venture to bestride their coursers. There is a hideous amount of yelling, but little other noise except the jingling of the hundreds of bells from a hundred sleighs running swiftly and smoothly along on the ice, within the track marked out by spruce bushes. "Men on foot and boys on skates crowd toward the winning-post in indescribable confusion. An ice-boat shoots past at the rate of thirty miles an hour, and half a dozen runaways is the immediate and inevitable consequence. But nobody is hurt. Each com-

petitor claims the 'heat,' swearing lustily that all the rest 'broke.' Each man is upheld by a circle of his own backers; the judge is bonneted, and the crowd, pending the next heat, is supplied with alcoholic refreshment by a speculative individual who has driven a puncheon of rum on a sled to the racecourse. How the winner is ultimately decided upon is a mystery, nor does it matter much, for the stakes are small, and, as for the honour and glory, they are equally divided." The population of this island is about 109,000, principally of English, Irish, Scottish, and Acadian-French descent. The Scots are

CANADIAN PRIMEVAL FOREST, BIRCH BARK CANOE, AND INDIAN LODGES.

said to belie the general reputation of their countrymen for doing well everywhere, while the French are, if possible, more clannish and even less apt to assimilate. Many of the Scots speak no language but Gaelic, and the French almost invariably speak the mother tongue, "live on potatoes and fish, marry in their teens, and seem to have no ambition to improve their condition in life." They are, however, in the minority, the rest of the colonists being a much more thrifty set, but preserving even more completely than the Canadians elsewhere the marks of the land from whence they came. There are only half a dozen policemen in the island, and even these could be dispensed with but for the occasional visits of the crews of English and American ships. The people are divided between the Protestant and Roman Catholic religion, and ecclesiastical feeling

runs high. Next to farming, ship-building is the chief industry of Prince Edward Island, and there are also a few tanneries, breweries, and cloth mills on the island. The fisheries are also valuable, especially those of lobsters and oysters. In a word, this island is entitled in some degree to be called the garden of the St. Lawrence. Its size offers room for only a few immigrants, but farmers with a small capital and agricultural labourers could do well here. The animals are much the same as those of the mainland; and among other game, hares, or as they are called, rabbits (*Lepus americanus*), are plentiful.

The island of Anticosti, in the Gulf of St. Lawrence, is not colonised. Attempts have been made to settle in it, but with little success hitherto. During six months of the year it is shut off from the outer world, and though a small farm might pay, yet, so long as there are other places to settle on, it is not likely that this outlier of Canada will have much attraction, except for fishermen. There is a good deal of game on it, but take it at its best, all in all, it is even to the lighthouse-keepers, who are accustomed to limited society, a very forlorn sort of home.

NEWFOUNDLAND.

The oldest colony of England has not yet entered into the newest confederation of its dependencies, and, therefore, is not as yet a part of the Dominion of Canada. We may, however, say a very few words about it. It is 317 miles in length, 316 in breadth, about 1,000 miles in circumference, has an area of 42,200 square miles, and had in 1883 a population of 185,000. The island presents a barren, rugged appearance, the cliffs being sometimes 1,000 feet in height, and the interior hills, such as those in the Avalon Peninsula, 1,400 feet in height. Numerous lakes, or "ponds," as they are called, indiscriminately cover the coast; indeed, it is calculated that one-third of the island is covered with water, while the coast is deeply indented with bays and inlets, which supply abundance of harbours. None of the rivers are navigable for any distance, and the interior is entirely uninhabited, even by Indians. The soil is too sterile to admit of agriculture to any great extent, though some cultivation is done in the settled districts, particularly in the vicinity of St. John's, the capital. About 600,000 bushels of potatoes, as well as oats, barley, carrots, and other crops, are produced annually; but the fisheries form the chief industry of the population. These are of two kinds—the "shore fishery" and the "bank fishery"—the one being followed in the immediate vicinity of the island, the other (Plate VIII.) on the banks of Newfoundland, cod being the chief fish caught, though herrings, salmon, and others are also abundant in the vicinity of the island. The seal fishery in the spring also affords lucrative employment for numbers of men (p. 80), while the lead, silver, and copper mines, now begun to be worked, are destined to add to the riches of the colony. There is only one railway on the island, and roads are confined almost altogether to the southern seaboard. Telegraphs have, however, been constructed, and the westward terminus of the Atlantic cable is in Newfoundland. Labrador—which in its general features may be likened to Newfoundland, and has been already referred to in the description of Arctic and sub-Arctic lands—and the island of Anticosti are also included within the jurisdiction of the island. Fogs often envelop the southern coasts, while the climate, though mild, is far from inviting to settlers, though, apart from the fisheries, and the possible trade in lumber,

it is claimed that there are 5,000,000 acres fitted for cultivation. The Newfoundland dog is believed to be indigenous to the island. At present these are employed as beasts of burden in the colony during the winter, being left to shift for themselves during the fishing season.*

MANITOBA.

The "prairie province" of Canada has more than once been mentioned. It is that part of the old Hudson's Bay Territories or Rupert's Land known as the Red River Country. It is, perhaps, the most valuable agricultural portion of Canada, but from its present isolation its value is not so thoroughly appreciated as it will be in time, when a railway joins it with the other portions of Canada. From the province of Ontario on to this central plain the country is densely wooded. Compared with the country on the Pacific Coast, Mr. Sandford Fleming does not think that it can be called mountainous—the highest point not being over 2,000 feet above the level of the sea—though a band of rocky hills runs along Lake Superior, ranging in width from forty to seventy miles. Between Lake Superior and Manitoba the drainage of the country is mainly westward, passing into Lake Winnipeg, and the country for the whole distance is remarkable for the innumerable streams and lakes by which it is intersected, so "that the Indian can travel in his canoe almost any required direction by making an occasional portage." These waterways consist of long winding sheets of water, separated by rocky ridges. Among the larger lakes may be mentioned Lake Nepigon, which discharges into Lake Superior by the Nepigon River, and is the most northerly reservoir of the St. Lawrence Basin. The general aspect of the country east of Lake Nepigon, as seen from Lakes Superior and Huron, is precipitous and rugged, but to the rear of this wild and frosty frontier the surveys made for the Canadian Pacific Railroad show that the surface descends northerly in easy slopes. "The drainage of the flat country referred to, as existing between the Nepigon Basin and the Ottawa Valley, flows northerly by the Rivers Albany and Moose to James's Bay, while the drainage of the rugged elevated belt along Lakes Superior and Huron passes into the basin of the St. Lawrence." The agricultural resources of this tract, familiar for many years as the route of the Hudson's Bay traders from the Red River to Canada, before they struck off through a similar country to Hudson's Bay, are not promising. Mineral wealth may, however, be discovered in it, and the timber which covers its surface will in time become valuable.

Of the general character of the great central plain of America we have for long had a more or less general acquaintance. But the explorations of Captain Palliser, Major Blakiston, and Dr. Hector, and more particularly the surveys of Mr. Sandford Fleming, for the purpose of a route for the proposed Canadian Pacific Railway, have given us so clear an account of it, that in the following remarks I shall avail myself of the latter distinguished engineer's official reports, which, by the courtesy of the Canadian Government, have been put before me. This vast continental plain stretches between the Rocky Mountain Zone on the Pacific

* Howley's "Geography of Newfoundland;" Pedley's "History of Newfoundland;" Jukes' "Excursions in and about Newfoundland;" Brown's "History of the Discovery of Newfoundland" (1869), &c.; Hind's "Explorations in the Interior of Labrador" (1863); "Hatton and Harvey: "Newfoundland" (1883), &c.

side and the Appalachian Zone on the Atlantic side of North America. Northward it is limited by Hudson's Bay and the Arctic Ocean, while southward it spreads almost without interruption to the Gulf of Mexico. This vast area, therefore, occupies the whole of North America between the eastern and western mountain systems. Its river systems divide it into two great drainage basins—the one, as in the case of the Missouri, flowing southerly to a tropical sea, the other, as in the instance of the Saskatchewan and Athabasca, discharging into an Arctic or sub-Arctic Ocean. A line drawn from the extreme westerly end of Lake Superior, “to a point where the forty-ninth parallel crosses the main Rocky Mountain range,” would tolerably closely approximate the dividing line between the southern and northern drainage basins. This great plain of Northern America, to which we shall have occasion yet to refer, when speaking of the parts of it politically under the United States, is divided through the centre artificially into “two adjacent countries under distinct Governments, and naturally into two vast drainage basins, which discharge their waters in opposite directions.” If a line be drawn from the Lake of the Woods to the east of this Northern prairie district, and on the forty-ninth parallel, it will strike, if drawn in a nearly straight north-westerly course, the general line of the Mackenzie River (p. 190), between latitudes 64° and 65° , and will pass through Lakes Winnipeg, Manitoba, and Winnipegosis, Deer Lake, Lake Wollaston, Lake Athabasca, Great Slave Lake, and Great Bear Lake, a remarkable series of sheets of water, rivalling in size Lakes Erie and Ontario. “These great excavations or depressions in the surface appear to occur on the separating line, between a broad band of Laurentian and metamorphic rocks, and more recent and softer formations. If we take this line as the base of a triangle, with one side extending from the base of the Rocky Mountains, and the other extending from the latter place northerly along the flank of the mountains to the Mackenzie River, a description of the leading physical features of the central country will be rendered extremely simple. The triangle will be nearly isosceles, with sides of from 900 to 1,000 miles each, and its base will measure in length about 1,500 miles. This vast triangle, containing about 300,000,000 acres, may be described generally as a great plain, sloping gently downwards from its apex to its base. Its apex is at the foot of the Rocky Mountain chain, between the sources of the Missouri and the South Saskatchewan, and is estimated to be about 4,000 feet above the sea level, while its base, lying along the series of lake expansions from Lake of the Woods to Great Slave Lake, will not, it is believed, average a higher elevation than 900 to 1,000 feet above the sea. The river systems, which carry off the waterflow of the long sloping plains, are the Assiniboine, the Saskatchewan, the Athabasca, and the Peace. The first two unite their waters in Lake Winnipeg before finally passing out through the Nelson River to Hudson's Bay. The last two are tributaries of the Mackenzie, and through the channel of that river ultimately reach the Arctic Ocean. Between the Saskatchewan and the Athabasca the River Churchill takes its rise, and flows independently in a generally north-eastern course, falling ultimately into Hudson's Bay. All the rivers of this division of the country flow for a great part of their length in deeply-wooded channels, frequently of considerable width, and, as the materials underlying the plains are, for the most part, drift or soft rock formation, the channels which have been furrowed out are not much obstructed by falls or dangerous

VIEW ON THE FRONTIERS OF CANADA.

rapids, but generally present, from the base of the mountains, throughout the greater part of their course, a uniform descent. Although the triangular-shaped territory referred to may be viewed in a general description as a great plain, sloping from its apex downward in a north-easterly direction to its base, its inclination is not perfectly uniform and quite unbroken. Several terraces and well-defined escarpments stretch across the country at wide intervals. Much of the surface is gently rolling, and distinct hills and eminences, some of them 500 to 800 feet above the surrounding level, are occasionally met with. The central division of the country may be described as prairie, although the whole triangular area referred to is not strictly so. The prairie land passes into woodland in various localities to the north of the Saskatchewan, to reappear in higher latitudes. On Peace River there are extensive prairies with extremely rich soil. In other localities there is an agreeable mixture of woodland and prairie, and this character of country appears to prevail as far as Hay River, 400 miles north of the River Saskatchewan. Although the prairie region is of vast extent, it is not at all fertile. A very large area adjoining the boundary of the United States, midway between Manitoba and the Rocky Mountain Zone, is arid and unfavourable for agriculture. In other quarters a great breadth of rich pasture and cultivable land exists.* The province of Manitoba is in reality a mere speck of the vast North-Western Territories, or Rupert's Land, out of which it is carved. It contains, nevertheless, about 9,000,000 acres, mostly prairie, consisting of rich alluvial soil, so clear that a "buggy" can be driven for a thousand miles over fertile lands capable of growing wheat and other vegetable products, in perhaps as great perfection as any other portion of the temperate North American Continent. Along the banks of the streams wood abounds, and the natural prairie is covered with rich nutritious grasses. The summers are hot, and the winters colder even than in other portions of Canada, but both seasons are very healthy. Snow disappears and ploughing commences in April, while the crops are harvested in August. The regular frosts seldom set in later than November, while Red River is rarely open for navigation earlier than the end of April. There are thus in Manitoba, as in the rest of the colder portions of Canada, two seasons—the summer, which is the period of activity, and the winter, a time when the settler rests from his labours. Principal Daniel Wilson remarks, that early in April the alders and willows of the Saskatchewan country are in bloom; and the prairie anemone then covers the southern exposures to the very verge of the retreating snow. May is hotter than in the provinces along the banks of the St. Lawrence, but the nights are cold, and even during the period of the greatest heats the cold night breeze brings heavy dews, and begets a pleasant change after the sultry hours of daylight. To use the language of the Rev. Professor Bryce, a resident of the province, "The juncture of the seasons is not very noticeable. Spring glides superbly into summer, summer into fine autumn weather, which, during the equinox, breaks up in a series of heavy gales of wind, accompanied by rain and snow. These are followed by that divine aftermath, the Indian summer, which attains its true glory only in the North-West. The haziness and dreary fervour of this mysterious season have often been attributed to the prairie fires,

* Report of Progress of the Exploration and Surveys for the Canadian Pacific Railway (1874), p. 2.

which range over half a continent in the fall, and evoke an enormous amount of heat and smoke." The North-West winters are, however, agreeable, and singularly steady. The snow is dry, and rain being unknown, the mocassin is the universal foot-gear, no other kind of shoe being so warm and light. The snow is shallow, but so gritty that it resembles white sand more than anything else. Even in the heart of the Rocky Mountains the snow is rarely so deep as in Eastern Canada. The dryness of the air of the Canadian winters render them pleasant. It is the spring and autumn frosts that the farmer, and especially the fruit-grower, fears; but it is said that the Red River country is less visited by these evils than the rest of the Dominion. In winter the thermometer will, in Manitoba, sink to thirty or forty degrees below zero, without the inhabitants—well wrapped up and using ordinary precautions—experiencing any unpleasant effect. The buffalo pastures during all the winter by scraping off the shallow snow to get at the grass, as do also horses and cattle for part of the winter. This portion of the country was originally, as we have already mentioned, settled by retired servants of the fur companies; and their descendants—usually of mixed Indian and white extraction—still form a very large portion of the population. The Scottish half-breed is decidedly the best. He is more civilised, is fonder of education, and of the ways of the white. The French half-breed, on the contrary, is rarely a good farmer, and is more of a hunter, is usually married to an Indian woman, and is ruled by his *belle mère*, or mother-in-law, of whom, moreover, he is usually rather prouder than the Scotsman similarly situated. The Scottish settlers generally herd together, and do not care much for their French neighbours. Settlers have of late poured in from Canada, Europe, and the United States. Winnipeg, which a few years ago was a mere Hudson's Bay post, and in 1871 contained only 241 inhabitants, is now a flourishing "city" of 10,000 people. Even these figures will be stale in a very short time, with all the appliances of civilisation. Towns, less ambitious but almost as "booming," are springing up like civic mushrooms along the route of the Pacific Railway, and though the long winters are unquestionably a drawback, and the "blizzards" or cold blasts not desirable, there is a fine future for Manitoba as soon as the land speculators relax their grip on her fat prairies. Coal is found in such abundance that it is selling in Winnipeg at thirty shillings per ton, and gold has also been washed out of the sands of some of the streams, advantages which go far to compensate for uncertain markets, unseasonable frosts, and an occasional visitation of voracious grasshoppers.

BRITISH COLUMBIA.

After leaving Manitoba the country westward changes. We now enter into a mountainous region, the eastern boundary of which is the Rocky Mountains, that Alpine region which stretches, with few interruptions, under one name or another, through the length of North America. In Mexico they are known as the Cordilleras. Just before reaching the Arctic Ocean the range branches into the Alaskan and Yukon Mountains towards Behring's Strait. It is an exceedingly complex region, the main range sending off lower spurs westward, while parallel to it run the Cascade range—

perhaps from a geographical point of view even more important—and the coast range which constitute the barriers of the Northern portion of Continent facing the Pacific.* The physical geography, however, of the Pacific slope of the Rocky Mountains, will be best described in a future chapter, when sketching the United States possessions comprised within it. Meantime, a few words on British Columbia, the largest, and perhaps the most important adherent of the Dominion, which lies sandwiched between Alaska on the north, and Washington Territory on the south, may suffice. Up to 1866 the colony was divided into two separate

ON THE ROAD TO THE CARIBOO MINES, BRITISH COLUMBIA. (From an Original Sketch.)

governments—those of Vancouver Island and British Columbia respectively—but in that year they combined, and in 1871 joined the Canadian Confederation. Vancouver Island is 280 miles in length, while the Queen Charlotte Islands, 130 miles to the north and west, are composed of three islands separated by narrow channels, and extended along the shore for nearly 200 miles. Vancouver Island, and the other groups lying off the British Columbia coast, may be looked upon as simply dis severed portions of the neighbouring mainland, their physical features entirely corresponding to that region. They are for the most part densely wooded with Douglas fir (*Abies Douglasii*), hemlock (*Abies Menziesii*), cedar

* Grant's "Ocean to Ocean" (1873) and Milton and Cheadle's "North-West Passage by Land" will give a good idea of the country in its more picturesque aspects.

(*Thuja gigantea*), and other coniferous trees of gigantic size, interspersed with an undergrowth of various berry-bearing shrubs, which render travel very laborious. The interior is scarcely so impeded with this matted growth, but any open land there may be is confined to the coast, and nearly all in the vicinity of Comox, or the southern end of the island, within a few miles of the capital, Victoria, a town of about 6,000 inhabitants. The country is flattish towards the northern end, but the middle portion is especially well wooded and mountainous, the valleys are filled with numerous deep lakes, fed and emptied

VIEW OF NEW WESTMINSTER, BRITISH COLUMBIA (LOOKING UP FRASER RIVER). (From an Original Photograph.)

by rapid streams, few of which are navigable even by canoes for more than a mile or two, any further progress having to be accomplished by laboriously propelling the skiffs by means of poles, varied by the canoe-men ever and anon jumping into the stream in order to either ease the canoe over shallow places, or to carry it round falls or rapids. Some of the higher hills or mountains attain, as in the case of Victoria Peak, Mount Albert Edward, and Alexandra Peak, the height of 7,484, 6,936, and 6,394 feet above the sea.

The whole country, more especially that fronting the Pacific, is intersected by deep fjords, or inlets, with high perpendicular walls, to which here and there the hardy fir clings, its roots laved by the tide. On the shores of nearly all these inlets, where the ground is flat enough to build a village, are found the broken remnants of the numerous Indian tribes

who once so densely peopled the shores, but who are now reduced to less than 10,000 souls. There are no inhabitants in the interior, the Indians being chiefly fishermen, who rarely go far out of sight of their village, while at present, so far as we know, the interior of Vancouver Island affords few attractions for the scanty number of white settlers who cling to the country in hope of better days than those they are now blessed with. The same words may fitly describe British Columbia to the west of the Cascade range, but to the east of that continuation of the California Sierra Nevadas the country is more open, consisting on the north of a hilly plateau, broken up by low hills, and dotted with numerous large lakes and channelled by many rivers, while the usual fir is replaced by pines (chiefly *P. ponderosa*), so thinly scattered over the country that in many places it is possible to ride through among them, a feat quite impossible in Vancouver Island, and in most parts of the coast region of British Columbia (p. 244).

The southern portion of the country is still more open, in some places even partaking of the character of park-like plains, well fitted for cattle grazing; but in no case are these open sections worthy of the name of prairies, often applied to them, at least when compared with the great seas of grass to the east of the Rocky Mountains. The chief rivers are—from north to south—the Stiken (partly in Alaska), the Nass, the Skena, and the Fraser, the greatest of them all, which falls into the Gulf of Georgia, a lovely island-dotted archipelego, in which the strait separates Vancouver Island from the mainland, and the Strait of Juan De Fuca, which divides the former from Washington Territory, ends. Easterly, the rivers are all navigable by steamers of small size, to where they pierce the Cascade Mountains. Here all navigation is stopped, owing to the formation of rapids, or the swift rush of the rivers through “cañons;” though in reality the name is only applicable to the deep cuts, with high walls, through which rivers like the Colorado flow in Arizona and elsewhere, as in due time we shall notice.

The climate in the country west of the Cascade is in summer lovely, and is even worthy of the term Italian sometimes applied to it. The hottest day is tempered by a cool breeze blowing from the snow peaks of Mount Baker in the Cascades, or from the Olympian range in Washington Territory, while the bright skies and the wild surroundings make summer life in that country perhaps as enjoyable as in any part of the world. The winters are, however, English in their intense moistness, rain falling with unintermitting disagreeableness. The spring, on the other hand, is frequently as early as March. Then the frogs are heard croaking in every pool, and by April the country, when open enough for the growth of flowers, as in the vicinity of Victoria, is yellow with the myriad *Galiums*, or blue with the *Gamass* lily (*Gamassia esculenta*), one of the most characteristic of the plants of the North-West, and which is still abundant, notwithstanding the fact that for unnumbered generations the Indians have dug up its bulbs in the autumn, and after roasting them, stored them away in bags for winter use. East of the Cascades the climate is different. The summers are dry and hot, the winters cold; but the cold is never that of Eastern Canada. The cattle will often graze out during the winter, and the harbours are never closed even in the northern portions of the province. Indeed, it is not every winter that sailing ships cannot reach New Westminster, sixteen miles from the mouth of Fraser River (p. 245). The country is very thinly peopled. Originally a hunting-ground of the Hudson's Bay

Company, it burst into reputation by the discovery of gold in Fraser River in 1858, and, subsequently, by the "rush" made to the newly-explored Cariboo Gold Mines near the upper reaches of that river (p. 249). The gold in Fraser is now all but exhausted—only a few Chinese working the "placers"—but large quantities of it are still taken out of the latter mines. Through the surface metal having been exhausted it can now only be obtained by sinking shafts and other expedients, which require the expenditure of large capital, and therefore allow of but little chance of private individuals gaining much by lucky "strikes," as in early days. Of late shallow diggings have been discovered in the northern portion of the province, and also in the south. Indeed, it may be safely said that the whole country, especially to the east of the Cascades, is one great gold-producing country. The towns are chiefly villages, which are, for the most part, scattered along the banks of the Fraser, or in the vicinity of the other routes to the gold mines. They owed their existence originally to the "gold excitement," and rise and dwindle almost in an exact ratio to the success or decline of the gold mines. The great resource of British Columbia, which is destined to give it future prosperity, is coal. It is of cretaceous age, and therefore inferior to that of England and Pennsylvania, but yet much superior to any other found on the Pacific coast, which is of still later geological date. At present it is mainly mined at Nanaimo, ninety miles from Victoria; but as the whole of the east coast of Vancouver Island is underlaid by the strata more mines will in time be opened out. There is also coal, but of an inferior description, on the southern coast, and it has also been found on the western shores of Vancouver Island, particularly in the extensive sounds of Quatseemo and Koskeemo, and in thick beds on the banks of Brown's River, a tributary of the Puntledge, which flows into the sea at the settlement of Comox (p. 197). Up to date the yield of gold amounts to about 50,000,000 dols., in addition to which silver is found; and copper is almost everywhere abundant, while ironstone exists in various places. Manufactures are few; saw-mills, the fur-trade, the fisheries, and farming are among the other occupations. Gold was discovered in 1865 in Leech River, twenty miles from Victoria, by the expedition under the command of the writer. Some of these primitive buildings in this "city" we have sketched on pp. 248, &c. They may stand as portraits of many other such dwellings in the mushroom settlements of the Far West. For a time considerable quantities of metal were extracted from the bed of the little stream, a tiny town sprung up, and a number of men found employment. The gold, however, soon became exhausted, and as no new deposits of any extent have been discovered, the diggings are now abandoned by all except a few Chinese, who still occasionally come on what are to those thrifty Mongols prizes of no small importance. The fisheries are really valuable, and would rank among the richest in the world were they properly developed. The rivers abound in sturgeon; cod-banks are found off the northern coast; halibut is extremely abundant and of enormous size, while, among other fish the very name of which would be strange to the reader, salmon of several species and of excellent qualities are found in prodigious abundance. In the bays they are caught during the season by the Indians by spearing,

* Diggings in which the gold is scattered in detached grains, nuggets, &c., through deposits of earth, gravel, &c., as distinguished from those in which the metal must be extracted from the quartz in veins.

and they ascend the rivers in such quantities that until the "canneries" absorbed the surplus they were allowed to rot for lack of salt to preserve them. It is a tale—and, unlike many of a similar description, is perfectly true—that at one of the Hudson's Bay forts so many were on one occasion caught, they were used to manure the gardens. Salmon can be bought in Victoria for 2½d. per lb., and I have seen the Indians selling them in the streets at the rate of three for a shilling when they happened to be very abundant. At Alberni, on the western shores of Vancouver Island, the traders bought them for salting at the

STORE AT THE LEECH RIVER GOLD MINES, VANCOUVER ISLAND, 1863. (From an Original Photograph.)

rate of a fish-hook apiece, and at the saw-milling establishment there the men used to all but mutiny if they had salmon oftener than twice a week for dinner. I may add that so plentiful were deer that now and then the same compliment was paid to venison or "deers'-meat." After the rivers fall the salmon may be seen "wobbling" about in the pools in the ford, affording most profitable amusement to the brown bears, who are fond of them, and are easily caught in traps baited with the fish. The dogfish (*Acanthias Suckleyi*) is also plentiful, and is caught by the Indians for the sake of the oil in its liver. This forms a considerable article of trade, being used to lubricate the machinery in the saw-mills of the province and of Puget Sound. Oysters are also found of small size, but the clam (*Lutraria maxima*) is the mussel, which, either plain boiled, baked, or in the form of "chowder" or soup, is most popular as an esculent. The Indians dry it for

winter food, and its collection and preservation are among the most characteristic occupations in a native village. The last fish which I shall mention is the oulachon, or candle fish (*Osmerus pacificus*), a species of smelt, which ascends the northern rivers in March. It is captured in great numbers by the Indians for food, but more particularly for the purpose of extracting the oil from its tissues. This oil, which is, when cold, of the consistency of palm-oil, is used for cooking, and is also eaten by the natives. It has also the good qualities

THE CAMERON CLAIM, WILLIAM'S CREEK, CARIBOO GOLD MINES (1863).

of cod liver oil without its nausea. Probably its use is the salvation of the natives of that part of the coast where chest diseases are very common. So highly valued is it by the Indians, that when they come to Victoria they always bring some boxes of it with them. One of them remarked to me that there were only two good things in the world—"rum and oulachon oil!"

British Columbia is not an agricultural country, and no number of pamphlets will ever make it so. The soil and climate are excellent for all crops of the milder temperate zone; but the open tracts are small in comparison with those found in the more favoured regions of the United States lying immediately south of the forty-ninth parallel. Clearing land at the present rate of labour will not pay, but when the market is sufficiently great to make it remunerative some of the drier tracts between the Cascades and the Rocky Mountains

will doubtless be cultivated by means of irrigation. At present the revenue of British Columbia is about 397,000 dols., and its expenditure 379,000 dols. During 1883 about 268,000 tons of coal were raised. The imports in 1882 were valued at 2,899,223 dols., while the exports, including gold, were 3,116,891 dols. Excluding gold, these exports were supplied by twenty-one articles of home produce; yet, in spite of all her resources, her pleasant climate, and great seaboard, British Columbia is not "booming." She is a lady with "great expectations." She has been, ever since the first flush of the Fraser River gold excitement expired, waiting—a sort of *Micawber* of Colonies—for "something to turn up." At one time Cariboo was to "make the country;" but that died the death of Fraser River. Then "lumber" was to be the fortune of everybody, but there was no market, and the big trees still grew. Then copper, then coal, gold, and sometimes silver, have been the materials on which the often sanguine colonists hoped "to hold on." Now and then a Governor more complaisant than ordinary was the coming man who was to "develop their resources," but in due time His Excellency was as the Pro-consuls who had gone before him and came after him. For a brief spell the colonists would decline to put their trust in princes, and try to make the best of what they had. They would salt salmon and send them to Sandwich Island, and to the Roman Catholic countries to the south, or would put them up in tins for whoever would buy them. But somehow or other the province progresses slowly, notwithstanding the political changes it makes. At present the Canadian Pacific Railroad is the something of the future which, when completed, everybody is to grow rich on. This railway is getting on rapidly: even Vancouver Island, which has water carriage to every spot where there is anybody settled, insists on having a railway to Nanaimo, along the coast. Meantime the population is increasing, though the undoubtedly great resources of the country are in that condition so abhorrent to the energetic sojourner in the new country—"undeveloped."

The chief obstacle to the progress of British Columbia is its isolation from its sister provinces, and from the mother country. The protective duties of the United States shut out its timber, and even to some extent its coal, from the San Francisco market, while the great distance of England and of Australia interferes with the wants of these countries being supplied from the "Queen Province of the Pacific." When these difficulties are overcome, British Columbia will undoubtedly prosper. In her there is the making of a great colony, but for many years it was a pleasanter country to visit than to reside in and win bread from, disagreeable as it is to say so of a land in whose joys and toils, anxieties and successes, the writer was for some of the happiest years of his life a sharer.

CONCLUDING REMARKS.

We have probably given a fuller account of the Canadian provinces than it will be possible to afford to some other portions of the world which will come before us in due course. But we are anxious, since it is impossible to devote full space to every country, to describe those which are less known, or which are of more peculiar interest to Englishmen, in greater detail, more especially when the writer possesses particular acquaintance with them. We have still, however, to write briefly of some other features of Canada,

or of Canadian life in its general aspects. The people of that country differ in many respects from those of the United States and of England. They have an accent of their own—partaking of the general Transatlantic drawl—and in their character they have also some features which at once stamp them as a race not yet out of the gristle period, but hardening into the bone of manhood. The men are equally energetic in business with those of the United States, but are capable of greater physical exertion. They bear the reputation, perhaps undeserved, of being exceedingly careful of their money, though, possibly, a little more scrupulous in obtaining it than some of their neighbours over the border. Sweeping censure, like sweeping praise, is, however, always dangerous, and in some cases utterly erroneous. Accordingly, it may be as well not to generalise upon premises, which will undoubtedly be declared erroneous, no matter what conclusions they may lead to. It cannot, at least, be denied that the Canadian women are as healthy in appearance as the men are robust. The true “American” woman may be pretty, but she soon fades, and she is ageing at thirty. The Canadian girl is, on the contrary, like the Englishwoman, in her prime at that period, and being addicted to out-of-door exercise maintains her freshness longer. She walks on snow-shoes, “trabogens,” and “rinks” out of doors, while inside her daily domestic duties take so much of her time that she indulges in little of the lassitude and languor which, unfortunately, too often afflict her American sister. The moral character of the people is high. In the town there are rogues, as there always are in large communities. In the country the people are orderly and peaceable. Farmyards are rarely enclosed. Timber lies all winter on the banks of the stream ready to be floated down when the ice disappears, and yet it is perfectly safe from depredation. In the farmhouse bolts and locks are unnecessary, while the farm implements lie in the field, and the stock often wander all summer through the woods till the autumn, when each owner claims his own. Education is free and compulsory, the teachers being paid by a school-tax levied on every citizen, while every ratepayer over twenty-one is entitled to a vote. Lastly, it may be added that the “manifest destiny” of Canada to go over to the United States is not believed in, except by a very small section of the country.

CHAPTER XIII

THE COMMERCE OF THE FOREST.

THE woods of America were at first its most distinguishing feature. It was the primeval forests that the first settlers had to contend with, and though their pride has been in many places humbled, yet, doubtless, for long the art of felling giant trees will be the prime art which the backwoodsman must be possessed of. They are not, however, always the enemy of the settler, for in Eastern Canada and the neighbouring United States they contain food also.

"SUGARING" AND CLEARING.

The sugar maple (*Acer saccharinum*) is familiar to nearly every one who has the most elementary knowledge of America. Spring is the season when the trees are tapped for the juice out of which the sugar is crystallised. Early in April the Indians and settlers, with their wives and families, repair to the backwoods for sugar making. The work partakes of all the character of a picnic, and, independently of the profit made, is enjoyed accordingly. Their first duty is to improvise pails, cups, and scoops out of the larch bark, out of which the canoes are also made. The "sugary" is then ready to be started. The trees are tapped in V-shaped incisions, and a spout of bark inserted into the place. The saccharine sap is then ascending briskly, and as it arrives at the cut flows out into the scoop, which conveys it into the trough below. A good tree will yield three gallons in a day; but this depends on the season, a warm day being better for it than a cold one, and especially is a sunny day after a frosty night favourable for the flow of the juice. About one pound of sugar is extracted from four gallons of sap. The sap is boiled until it becomes hard when dropped on the snow. It is then considered sufficiently boiled, and is strained through a blanket—not always a perfectly clean one—and poured into bark basins, when it soon hardens. The work of preparing the sap falls to the lot of the men, the women and children being always too fully occupied in tapping the trees and collecting the sap. Mr. Rowan mentions that one man will sometimes tap 200 or 300 trees; and that an Indian, with his wife and child, can make 600lbs. of maple sugar in one spring. The average run of a tree is twenty gallons in the season; and, strange to say, the tapping process does not seem to injure it, as it can be bled several seasons after without utterly destroying its health. In 1882 it was calculated that 20,556,019 lbs. of maple sugar were manufactured throughout the seven Canadian provinces.

Passing over the many beautiful and useful trees with which the Eastern American forests abound, and which render them gaye than the more monotonous though even more extensive pine solitudes of the Pacific coast, we may pass on to the use to which of all others they are put, viz., hewing them down for the sake of their timber. A settler born in the backwoods seems to have a perfect antipathy to trees. He is—metaphorically—born with an axe in his hand, which is to him what the proverbial silver spoon is to more favoured youths. With that handy American axe of his he slashes and hews at the great woodland crop which, though he never sowed, he yet reaps. He "clears" the land to sow corn on it, and burns what timber he cannot utilise for fuel or for buildings. If the timber be of a size and character fitted for being sawn into boards, and his "location" is near a river or lake, the settler finds it more profitable to convert it into "lumber;" and to do this requires careful felling, and an entirely new system of going to work. It is quite a mistake to suppose that land cleared of saleable timber is ready for the plough; on the contrary, it is covered with spare forest-trees unfitted for the axe, bush, and a wilderness of tall stumps. In a few years—fourteen or fifteen, it has been estimated—the slim trees will be thick ones, and again the lumberman may erect his

camp and hew again at the forest. In fact, if the Canadian and United States Government showed anything like foresight and care, there need—over a great portion of both countries—

SAW-MILLS IN A FOREST OF PINES.

be no outcry respecting the destruction of the "lumber" forests. Timber is one of the most lucrative of crops; and if the trees cut down were re-planted, as they are in many countries, or if care were taken to prevent forest fires, which in a very great number of cases are

caused by carelessness and wanton mischief, this important branch of American commerce might be fed for a period practically indefinite. Arboriculture and forestry are, however, sciences the meanings of which are as yet scarcely understood in America, and already it is experiencing the exceeding wastefulness of a civilisation, which consists in destroying recklessly every wild beast and every wild tree within its borders.

LUMBERING IN EASTERN AMERICA.

"Lumbering," both in Canada and the United States, is an important employment. Winter is, over great portions of the country, a dead season. The settlers are unemployed, and those who have skill in that direction take to chopping the pine woods. It is also one of those employments which are well paid. The wages are from ten to thirty dollars per month, and twenty to thirty dollars for a pair of horses, food, in both cases, being provided by the employer and hirer.

In Eastern America winter is the season when lumbering commences. The first snow is the signal for the men to take to the woods to hew down the trees which have been previously marked by the parties sent out to explore the various timber limits leased from the Government by the mill-owners. In gangs of from six up to twenty men they go to work. First of all, they build log camps, or "shanties," for themselves, and "hovels" for their horses, or cattle, if they prefer them. "Each camp has a main or 'portage road' leading to the nearest settlement or turnpike road, which is sometimes as much as fifty, sixty, or one hundred miles distant. Along this road their provisions are 'portaged.' This alone gives work to one team when the gang is large and the distance great. Flour, pork, tea, and molasses form the staples of their diet. They breakfast before daybreak, dine about ten or eleven, have a 'bite' at two or three, supper at six, and a 'lunch' before they go to sleep—not bad living; and at any hour of the day or night that a stranger happens to visit them, on go the kettle and frying-pan, and he is treated to the best they can give him." In a camp of, say, twenty men, there are the "boss" or foreman, the cook, the teamster, and the teamster's "divil" or assistant, young men, highly paid, and gifted with a profundity of bad language, which they plentifully bestow on their charges, the beasts of draught. The latter haul the logs from the stump, and deposit them on the bank of the stream down which they are to be floated in the spring. These are the officials; then come the rank and file, viz., five broad-axemen, who square the logs; the "head swamper," i.e., the engineer or road maker, who, of course, is also an officer, but not so highly paid as the teamster and cook; and four "fallers," or choppers, who initiate the work for all the others. The men are worked hard, but the labour is tolerably lucrative, though, indeed, much of their wages is swallowed up in the "store" of their employer; and it is only the very provident who come out of the woods in the spring with any great savings. The horses are fed on oats, but are too hard worked to last long, though they are selected for their strength, and actually calculated at so much per pound when being bought. In the winter the cold is often intense; the men accordingly consume great quantities of pork and other fat food. That this diet is best suited for them, is

proved by the fact that they look down on beaver, rabbit, moose, caribou, and all other deer's meat, as "having no strength in it." "The camps are generally situated in hardwood land, near a brook or river. They are built of spruce logs, well padded with moss, and roofed with cedar or pine splits [p. 256]. The hearth is in the centre of the camp, with a bench or 'deacon seat' on each side of the fire. Back of this are the beds or 'bunks,' made of hay or hemlock boughs, constantly renewed. The stables and hovels are close to the camp, and are made in the same manner, but, of course, without the fireplace, and with a loft for hay overhead. Neither horses nor men ever suffer from cold in the lumber woods; there is no wind, and the deep snow banked up round the camps and hovels adds greatly to the warmth." Nor are the "logging camps" without their amusements. The talk is monotonous after the accumulated stock of anecdotes has become exhausted; and its character is not of the most refined description; but, on fine Sundays, to get the horses of rival logging camps to pull against each other is, to the loggers, superb enjoyment, and is perhaps somewhat more moral than a race at Ascot or at Epsom. Yet they lead a happy life; free from care and in robust health, they earn by their day's toil a sound sleep at night, and if their winter work is dull the summer finale to it is, on the other hand, lively in the extreme. The store of logs accumulated on the bank of some stream, the lumbermen leave their camp and prepare for the exciting work of the spring campaign. Hitherto, all the rivers have been frozen over; land and water have slept. In spring the world comes back to life. Little by little, slowly and growlingly at first, but eventually with a crash and a roar, the ice-sheets burst asunder, pile over one another, undermine the banks, and then sail down the current, perhaps to reach the sea half melted, or to be stranded on meadow or intervalles many miles from the rendezvous of all the rivers. Then the lumberman is busy—for "freshet time" is the most critical of all seasons to him. If he neglect to get his logs rafted down he may have to wait another year before the produce of his winter labour can be sold. "If the snow thaws very rapidly, and the freshet rushes to an unusual height, his logs are scattered over the meadows and intervalles, and collecting them is great labour. Each log and stick of timber has upon it the private mark of the owner. They all float down the stream together, but are claimed and sorted out at the rafting grounds. Here booms are stretched across the river to collect the lumber, which is made into rafts, and either floated down by the stream or towed by steam tug down to the sea. The rivers in Canada have a lively appearance in the months of May and June. Hardly has the last of the ice disappeared when the logs commence to run. From daybreak in the morning until dark the stream drivers are at work: some in the water; some walking on the slippery floating logs—as only a lumberman can; others paddling about in canoes, pushing off their logs from the bank, guiding them through the broken water, and finally making them into rafts. This is a period of very hard and severe work for the men, who are highly paid, and of great anxiety to the lumberer." These floating villages, with their shanties, their blazing fires kindled on an earthen hearth, and the streaming banners waving in the wind as they float down stream, is one of the most characteristic and impressive sights of Canada during the early spring and summer months (pp. 212, 225). If a log could speak, it would tell of many an hour's hard toil spent on it, from the day it was first marked for cutting in the heart of the forest to the day it was shipped at Quebec. It would also bear testimony to the honesty of the Canadian people. The

lumber is cast away in all sorts of strange places by the freshet—in meadows, in fields, in creeks, and gullies, far away from the banks of the river, where it lies sometimes for months unsought and unclaimed; but rarely, if ever, is a stick of timber stolen in Canada. Nor is this work unattended with danger. Loosely joined together in huge uncouth rafts, the logs are set adrift, and with a few poles and roughly-shapen oars to guide them, the lumbermen in charge go down the currents and rapids of deep rivers, swollen and

A LOGGING CAMP NEAR AIBERNI, ON THE WESTERN SHORES OF VANCOUVER ISLAND, WITH SPROAT'S LAKE IN THE BACKGROUND. (From Original Sketches.)

flowing fiercely with the waters from the melting snow. A large raft in New Brunswick contains about 18,000 logs, and covers a space of some ten acres. As long as the logs hold together, all is well; but, hurried and tumbled over rapids, they often break up; and woe betide the unhappy lumbermen who are on them when the great logs come rolling in fierce confusion one on the other, and go smashing down the rapids from rock to rock till they are cast adrift in some open reach! When such accidents occur, as they frequently do, it sometimes happens that the logs get so wedged and bound together on the brow of some strong rapid that they remain immovable, and all the miles of logs which are following them are stopped at once. It then becomes necessary to cut the obstructing logs, or "timber jam," as it is called, with axes

VIEW OF A NEW SETTLEMENT IN THE NORTH-WEST.

Only the bravest, coolest, and most experienced of the lumberers can attempt this most dangerous of all their tasks; for when once the logs which bar the passage are half cut through, the weight of the press behind breaks them like straws, and some 10,000 trunks of trees come plunging down with a rush and confusion that but too often render all the coolness and activity of those who are trying to escape the avalanche of no avail. During the summer the shanties and the lakes become a perfect solitude,

BACKWOODS HOTEL, LEECH RIVER (1863). (From an Original Photograph.)

for the "log-chopper" has become a "log-driver," and the toiling oxen or horses are permitted to enjoy their summer rest on the farms of their masters.

In the provinces of Ontario and Quebec, a large portion of the logs are transformed at the saw-mills, near the mouth of the rivers on which they have been cut, into sawn lumber, deals, and planks. It is these mills, in fact, which have developed the country for miles around them, and opened up in the heart of the wilderness fruitful lands and settlements. As a specimen of how one trade helps another it may be added that one firm of saw-millers alone, employing 165 men and boys, consume annually 750 tons of hay, 25,000 bushels of oats, 5,000 bushels of turnips, 6,000 bushels of potatoes, 1,000 barrels of pork, 9,000 barrels of flour, and 2,000 barrels of oatmeal—in all, about 2,000 tons of produce alone are absorbed by a single firm, which is, moreover, only one of many similar.* Mr.

* Canadian Correspondent of the *Scotsman*, December 29, 1870

Rowan, to whose account of Canadian lumbering we are indebted for much of this description—and the description applies equally to all Eastern America—very truly remarks that to the immigrant this business presents no attraction. It is one that cannot easily be overdone by competition or swamped by cheap European labour. Long education is necessary for any one to become an adept in the use of the axe. It is really a fine-art sight to see a thorough axeman at work. How easily—almost without an effort, one would think—he swings the axe over his head, but every time brings it down within a hair's-breadth of the right place! Not a blow is wasted. At every stroke a huge wedge-shaped chip flies; and with a sound that makes the silent forest echo, the great tree shriven, creases, and then crashes to the ground, bringing along with it often a thicket of its smaller relatives, which have grown up under its shade. The work of an axeman is well calculated to bring into play all the muscles of the body. Accordingly, the *physique* of the Canadian and State of Maine men—who are all accustomed to this work—is splendid. Most of them are unusually tall, and without having that yellow sickly colour so common in the American townsman. The lumberman who passes his life in active, healthy work, inhaling the reviving breath of the pine forest, has not an ounce of superfluous fat, while every muscle is developed to its normal size. In addition to the lumber trade proper, there is an increasing demand in Canada for the minor products of the forest, such as Canada balsam, spruce gum, oil of hemlock (*Abies canadensis*), hemlock bark, sassafras root (*S. officinale*), sumach for dyeing, &c. An extract has been obtained from the hemlock bark which puts all the tanning properties of the bark into smaller space—always a desideratum in a country where the labour of transport is great. This trade also aids the lumberman; for by causing numbers of hemlock trees to be stripped of their bark, it leaves them ready for cutting into logs. These hemlock trees, when growing, are graceful in appearance, their foliage being peculiarly feathered; but when old, the bark gets rough and gnarled, and the foliage loses that pencilled grace which it possessed in its younger growth, thus proving false to the song in its honour, which says—

“O hemlock tree! O hemlock tree! how faithful are thy branches.”

In 1882 the exports of Canada amounted to 102,159,243 dollars, and of this sum 24,960,012 dollars must be credited to her forests. Much capital is embarked in the trade, and immense energy, foresight, and enterprise are developed by it. In addition to the sums expended in wages and in provisions for men and beasts, great expense is often incurred in forming timber slides in rivers which are interrupted by falls. So important, however, is it to the interests of the country that the rivers should be suitable for rafting down logs, that on some of the main channels, such as the Ottawa, the Government has, very properly, charged itself with the construction and maintenance of the chief timber slides. The yearly expense of transporting timber from the districts where it is hewn to Quebec is estimated at about 700,000 dollars, and at least three months are consumed in its transport; the interest of that money being necessarily lost in the interval. Rafting, moreover, can only be conducted at certain seasons; and, accordingly, the Quebec merchants have to accumulate large stocks to lie over all the winter, so as to be ready for the spring fleet, thus locking up capital to the extent

of about two millions of dollars, with interest on the same lost altogether for six months.

All over North America lumbering is followed on a more or less extensive scale. It is, however, only in the great forests of the North, and along the courses of the rivers and lakes, that it can be pursued profitably as a branch of commerce. Accordingly we find it pursued here and there in the vicinity of all the higher rivers, and right on to the bottom of Lake Michigan, where, at Green Bay, for example, there is considerable work of this description done. As we get further and further from the sea, and water communication gets less and less, lumbering ceases to be a trade, and is only followed for the purpose of supplying domestic or farming wants. In the central regions of the Continent, indeed, the *matériel* itself ceases. When we cross the Rocky Mountains the business begins again. At first we find small saw-mills, for the purpose of supplying the gold-diggers with "sluice-box" lumber, and other timber used in building houses or in mining operations. Small mills are also found in the vicinity of the settlements; and when we reach the sea again the business attains the dignity of commerce, and great saw-mills ship it off from the Pacific sea-board as it was shipped from the Atlantic. Puget Sound, Vancouver Island, and the sea-board of British Columbia, are the chief localities in the north; while further south, here and there on the coast of Washington Territory and Oregon, the trade is followed; and in California, in addition to many smaller saw-mills for local purposes, there are great logging or saw-milling establishments in the red wood (*Sequoia sempervirens*) forest, which extend along the coast up to lat. 42°. Lumbering on the Pacific and Atlantic sides of the Continent are, however, somewhat different. In the first region, the trees are different in species and more gigantic in size, owing to the milder and wetter climate; then, little snow falling in the winter, and the rivers rarely being frozen up, lumbering is not followed in the winter alone, but all the year round. Again, labour being high, and the virgin forests as yet almost untouched, it is neither practicable nor necessary to go so far back into the wilds to obtain logs as in Canada and "the States;" indeed, operations are carried on almost on the sea-board. To complete this sketch, therefore, of the earliest, and one of the most wide-spread of American industries, I must describe lumbering on the Pacific separately.*

LUMBERING ON THE NORTH PACIFIC COAST.

The work at a saw-milling establishment, say in Vancouver Island or Puget Sound, as elsewhere, consists of two main divisions, namely, getting the timber from the woods, and cutting it up into planks, at the mills. The saw-mill owner occasionally undertakes the work in the woods on his own account, but more usually makes a contract with a "logger," who engages for a certain price to deliver logs into the mill-pond close to the mill.

Having secured his "claim" to a portion of forest land bordering on the water, the "logger" proceeds to make a "main" road from the most densely-wooded part of the land to the water-side, commonly to some small bay. At the water-side end of the road

* In drawing up this description, though speaking of what I am personally familiar with, I have been greatly indebted to notes supplied me by my friend, the Hon. Gilbert Malcolm Sproat, Commissioner of Indian Affairs in British Columbia, and formerly Agent-General of the Province, who is very intimately acquainted with the whole subject.

he makes a slide of smooth logs, down which the logs brought from the forest roll into the water. Each logger, it may be added, has, as in the Eastern States, private marks chipped on every log, so that it may be at once recognised and claimed if it should go adrift. "Booms" are placed across to confine the logs until a sufficient quantity is obtained to form what is called a "boom of logs" for the mill. The logger next selects a suitable spot for his hut, and for a hovel for the oxen employed in dragging the logs, oxen being here universally employed in preference to horses. About a dozen men are engaged for the different operations of clearing away the brushwood, cutting the tree down, barking it, and sawing it across when felled into the required lengths, and for driving the team of oxen. A cook is also employed to take charge of the house and stores, and to cook for the party. This small establishment in the forest is called a "logging camp;" and at these camps, as in logging camps generally, the traveller usually receives a hearty welcome, and abundance of good wholesome fare—coffee, fresh bread, venison, salmon, beef and pork, potatoes, dried apples, fresh butter, pickles, &c. The work is very hard, and can only be done by men long accustomed to it. Most of the loggers come from Canada or the State of Maine, where they have been used to the axe from boyhood. Europeans are hardly worth their food until they have been some time at it. Removing the brushwood, called "swamping" (p. 254), is the only portion of the work that a "green hand" can undertake, and he must be a handy man to make a figure at that. The choppers and the teamster are the highest paid men. They receive from fifty to sixty dollars (£10 to £12) per month, with food. The others are only paid from £6 to £8 per month, with food, which, it may be added, is invariably the rule when workmen are employed at such establishments on the Pacific coast. Where the place is distant from a mill, and boards cannot be obtained, the house is built of logs, with moss stuffed between them, and the roof is made of long splints of cedar (*Thuja gigantea*). It is warm and water-tight. The inside is a large room, with open sleeping "bunks" placed round. In the centre is a wood fire, and above it a wooden open chimney coming down through the roof, like a vast extinguisher. In one corner of the room the cook has an American iron cooking-stove, while a long table and benches, at which the men take their meals, complete the furniture of these artisans of the forest. The axe used in chopping is a small one, of American make, with a long handle. The English manufacturers, though furnished with samples of this axe, do not seem to have succeeded in making it so as to satisfy the woodmen. A true woodman hardly knows what to do with his hands unless he has an axe in them. It seems indispensable to him, and it is astonishing how quickly and well he can fell trees, make roads, or build houses with it. Failing the axe, the lumberman, like most Western men, is fond of whittling, and when sitting in the summer evening in front of his often picturesquely-situated cabin, is usually seen leisurely and artlessly shaving down a "shingle," or, still better, the soft cheese-like white pine, if he be fortunate enough to lay his hands on a piece. The loggers of the North-West are a fine, manly, intelligent set of men. They have generally been fairly educated, and have seen a good deal of the world. Having few opportunities of spending money in the woods, and being well paid, those of them who resist the temptation to waste their earnings when they visit the towns are able to save money, and can get on to be logging contractors themselves.

The other portion of the work, namely, at the saw-mill, may now be noticed. From fifty to sixty men are employed at a large mill, in the capacity of engineers, firemen, log-haulers, gang-sawyers, circular-sawyers, cross-cutters, filers, blacksmiths, and men employed in carrying and stacking the planks. Several of these occupations require special skill, but many are open to the ordinary labourer. Consequently, the men at a

LUMBER WHARF ON THE NORTH PACIFIC COAST.

mill are, on an average, scarcely equal to those in the logging camps. There are more rough characters among the people at the mill. The married men at a saw-mill live in small wooden cottages; the unmarried men have one or two barracks or dormitories. There is a cook-house, with a large mess-house attached, where the men have their three daily meals. They work from six to six, with only half an hour for dinner. The wages of the labourers are about £5 or £6 per month, with board and lodging; and the skilled men receive, according to their occupations, from £8 to £12 and £13 per month, board and lodging. The proprietors usually have a large general shop at the mill to supply the wants of the men and their families. The mills are generally driven by steam power, the

refuse of the logs supplying abundance of fuel. The saws consist of upright "gang" saws and "circular" saws. The wood on being sawn is run out of the mill on to the wharf, and the ships' crews take it into the vessels, which load "bow on" to the wharf (p. 261).

With the exception of the cedar, which is used for making shingles for roofing, and by the natives for canoes and a dozen other uses, the *Abies Douglasii* is the only "merchantable" wood in large quantities of the forest trees north of the Columbia River. (In California they have the red wood, the scented cedar—*Cupressus Lawsoniana*—and other trees, but these do not extend to the great lumbering region of the North.) The Douglas fir is called indiscriminately, in foreign markets, Oregon, Puget Sound, Vancouver or red fir, pine, &c. It grows all over the North-West, though rare north of Milbank Sound, in 52° N.L. Though contracting greatly in drying, yet, from its strength and power of bearing tension, it is the best of North-West conifers. The white fir (*Picea*), to the unscientific observer, looks in the forests not unlike it, but its wood is soft, and not believed to be durable. A cargo of masts or of sawn timber would be spoilt if it were known that white firs were amongst it. The *Abies Douglasii* grows very sound. Those from the Eastern provinces who have been accustomed—as, for instance, on the Ottawa—to see tracts of fine-looking forest useless from the unsoundness of the trees, are surprised to find such a healthy forest growth in the North-West. The price of the sawn wood, or "lumber," is from 40s. to 44s. per thousand feet of "board measure" (twelve inches square and one inch thick), for ordinary lengths, say, from twenty to thirty feet. Large pieces cost more; flooring boards, planed on one side, tongued and grooved, cost £5 per thousand feet. As a "merchantable" wood, the *Abies Douglasii* does not enter into competition with the Swedish or Canadian yellow pine. It is a stronger, coarser, and more durable wood, and more resembles the pitch pine of the South States than either the Swedish or Canadian. It is possible to make planed doors and window-frames, or flooring, of selected pieces of *Abies Douglasii*, and these look well and wear well; but the wood is specially fitted for rafters, joists, and heavy carpentering work, in which the Canadian and Swedish timber would be less suitable. Owing to its compactness and tough strong fibre, the *Abies Douglasii* is not so easily sawn or worked as the softer pines, and is, therefore, less liked by the carpenters. Large quantities are exported to the northern parts of China, the Sandwich Islands, the west coast of South America, and to Australia. But freight is too high to enable it to be brought to England at a profit, except in the form of masts. In 1882, about £60,000 worth of lumber was exported from British Columbia.

From the first days of San Francisco, that town and a large portion of the State of California have been supplied with this wood by the saw-mills of Puget Sound, 800 miles north of San Francisco. The wood, the cribs or coffer dams, forming part of the "made" ground on which a great portion of the city stands, also the wharves, the wooden houses, the heavy carpentering in the brick and stone structures, and all the agricultural requirements of the districts accessible to the wood merchants of San Francisco, are supplied by this wood. The red wood, or red cedar (*Sequoia sempervirens*), which is lighter and smoother, and used for door and window-frames, is the only wood for general use obtainable in any quantity in that portion of California which borders the ocean. San Francisco thus looks to Puget Sound for her supply of fir wood.

There are no finer trees in the world for masts and yards than the *Abies Douglasii*. The wood of these is probably superior to the best Riga pine that can be got. Those who have tried the Douglas and the Southern States pitch pine prefer the former. It is used in the navies of various European countries.* There would be a large consumption of this wood in Britain for the mercantile navy if the high freight did not check its importation. Of late years, also, many of our merchant vessels use iron masts. Mast-
 ing pieces can be got of all sizes, from five inches in diameter to forty inches; the large pieces being, of course, much more easily obtained than the small. The price, free on board, in the North-West, is, according to size and character, so much per running foot. It is only a portion of a tree, of course, which has all the requisites for making a mast or a yard. The height of many of the trees as they grow in the woods is very great. "I have been told," writes Mr. Sproat in his notes, "that there was a tree lying on the ground, in some part of Puget Sound, which measured over 400 feet as it lay; but I am inclined to think the feet must have been short in this case. I can speak of what I have myself seen. The highest flag-pole in Europe is the Douglas fir one in Kew Gardens, near London, which measures 165 feet. This tree was sent home by a friend of mine from the North-West coast, and presented to the Gardens. Another flag-pole, still larger, was sent home by the same gentleman for the Great Exhibition of 1862, but arrived too late; and this, which measured 185 feet, was broken by being knocked against a bridge in the River Thames as it was being conveyed up-stream on the deck of a small steamer. The last-mentioned pole had no greater diameter than twenty inches, being meant for a flag-pole. As it grew in the woods it measured 221 feet, for I myself measured it after it fell. It was one of the shortest of five trees, all of which broke in the felling. Beds of branches were prepared to receive them, but four of the trees, one after the other, received injury in falling. The beds of branches were very carefully attended to for the last tree. Just as it was about to fall, a puff of wind blew it in the opposite direction, and the tree crashed down between the other trees, and, happily, fell on the bare ground uninjured. Beds of branches are only required in felling these long slender poles; the largest full-proportioned trees fall without breaking the trunks." The gigantic stature of the Douglas fir is not confined to that tree. The Menzies spruce (p. 161) and others are equally tall, and even thicker. I have measured a cedar (*Thuja gigantea*), on the Nittinat River, in Vancouver Island, which was forty-five feet in circumference; and, of course, the "Big trees" of California (*Sequoia* or *Wellingtonia gigantea*) are very familiar by reputation to every one. In a future chapter I may have a little to say on these and other Californian wonders.

* See Forbes' "Prize Essay on Vancouver Island" (1852); Sproat's "British Columbia" (1876); Anderson's "The Dominion at the West—Prize Essay" (1872); Lundin Brown's "Prize Essay on British Columbia" (1863); and the works of Mayne, Macfie, Pemberton, Rattray, and others on the Province; also the Canadian Geological Survey Reports; Fleming's "England and Canada" (1884); and Barneby's "Life and Labour in the Far, Far West" (1884). I have to acknowledge the great assistance I have derived in writing this section from the official and other papers kindly put at my disposal by the Agent-General of Canada.

CHAPTER XIV.

THE UNITED STATES: THE FARTHEST WEST.

THE preceding chapters have afforded us glimpses of the physical geography of North America. Partially the Dominion of Canada shares in the physical features of the United States. Like it, it falls naturally under three divisions—the Eastern, the Central, and the farthest West, or Pacific region. But it is only when we consider the United States that we see the marked character of these three great geographical regions of the Northern portion of the Continent. Accordingly, we may arrange what we have to say of the Great Republic and its people under these heads. Information about the United States being so easily accessible, and the subject being too extensive to be anything but sketched in the space we can afford to it, in accordance with the plan already described, we shall merely trace a few of the more prominent features of the United States, and mainly those which, unlike the statistics, manufactures, towns, population, and settlements, are not changeable, and liable to be altered before the pages which describe them have been long before the reader. Physically considered, therefore, with reference to its conformation, climate, and productions, the United States may be divided into three great and tolerably well-marked regions—the mountain slope of the East, or Atlantic section, the central plains, and the mountain region of the West. Leaving the first two to be described in future chapters, we may briefly characterise the last, as consisting, in the words of Dr. Bryce, of an elevated plateau, extending through 15° of latitude, and from 600 to 1,000 miles broad, supported on the east by the great chain of the Rocky Mountains, and on the west by the Sierra Nevada and Cascade ranges. The plateau, in its middle and broadest part, comprehends the States of Nevada, Utah, and parts of Colorado and Wyoming, and has an area of 250,000 square miles. In its eastern and southern parts the height is between 5,000, and 6,000 feet, but in Western Utah and Nevada from 4,000 to 5,000 feet, while north of the Humboldt River, where the waters divide, it exceeds 4,000 feet. It is divided into two unequal portions by the Wahsatch Mountains, whose highest summits reach from 4,000 to 7,000 feet above the plateau—that is, from 8,000 to 11,000 feet above the sea—and are always covered with snow (p. 265). The western part is the largest, and is about 400 miles long from east to west, and 300 broad. Spurs from the bounding ranges descend into it, and it has several short ridges of hills running north and south, of recent volcanic origin, and rising 1,000 to 4,000 feet above the general level. The valleys between are about twenty miles wide, and of great length, but often they are cut off by low cross-ridges connecting the higher north and south ranges. Almost wholly shut in by mountains, and having its own system of lakes and rivers, this region is aptly termed the Great Basin. Much of the surface is covered with saline and alkaline incrustations, which give off a blinding dust under strong winds. The country is almost rainless, and the waters are most salt and brackish, and one lake at least is saturated with salt, and without life of any kind. Except the Humboldt River, and the few streams descending from the snow-clad peaks of the bounding ranges, and soon lost in “sinks,”

CANYON IN THE WAHSATCH MOUNTAINS, (UTAH TERRITORY).

the only fresh water in the basin is Lake Utah, with the River Jordan issuing from it, and entering the Great Salt Lake. It is only near these waters that fertile tracts and thriving settlements are found; the rest of the basin is a hopeless desert. The tract of Utah, east of the Wahsatch Mountains, is equally sterile, and we have there an area somewhat larger than Spain or Portugal, unfit, save in a few favoured spots, for the permanent abode of civilised man. The south-eastern part of the plateau consists of an arid broken country, into which strata the Colorado, and its tributaries, the Grand and Green Rivers, have cut through several hundreds of miles cañons or gorges from 2,000 to 4,000 feet in depth, not only in the soft beds of chalk and sandstone, but even through several hundred feet of the underlying hard granite (p. 288). These vast cañons render much of the country quite impassable by man and quadrupeds. Emerging from its cañoned plateau, about the thirty-fifth parallel, the Colorado wanders through sultry valleys from 1,000 to 2,000 feet in height, the country becoming more arid and sterile as the head of the Gulf of California is approached. In this wide region of the West vast tracts are occupied by mountain ranges, and much of it must ever remain untenanted. It contains, however, one of the finest states of the Union, the great state of California, and the maritime region or Pacific slope. West of the Coast range and Cascade Mountains is a well-watered and fertile region, with a fine climate and rich vegetation. In it are comprised most of Alaska, Vancouver Island, and British Columbia, Washington Territory, and Oregon.

Before saying a few words on each of these political divisions individually, we may describe more generally and systematically the physical features of the Great Pacific slope. In doing so we shall draw on original materials, published and unpublished, acquired during many days' weary wandering afoot through the whole region to be described from California to Alaska, and from the sea to the Rocky Mountains.

There are three marked ranges of mountains which materially affect the physical geography of the Pacific slopes of the Rocky Mountains. These are (1), the Rocky (or as it was formerly and ought still to be called, the Chippewayan) Mountain range, stretching into South America under the name of the Andes;* (2), the Cascade range; and (3), the Coast range, a low and comparatively insignificant chain bordering the region immediately off the coast. All of these chains run nearly north and south from—or as far as we have yet explored—Alaska, until, entering California, they change their names in some instances, but are *de facto* to a great extent the same ranges. This is eminently true of the Cascade range, which runs down through British Columbia, Washington Territory, and Oregon, until, in the southern portion of the last-named

* I am well aware that this is only a sweeping generalisation, for, speaking in strict orographical language, there are many breaks in the continuity of the chain. Thus, the Sierra Madre of Mexico lies several degrees, both of latitude and longitude, distant from the nearest point of the Rocky Mountains, and the Andes are but imperfectly represented in the hills of the Isthmus of Panama, while these again are only distantly connected with the mountains and table lands of Upper Mosquito, of Honduras, and Guatemala, or with the volcanic cones which stand out in isolated beauty from the Plains of Nicaragua and San Salvador. Still, I cannot but think that Julius Froebel takes up an untenable position when he entirely denies the connection of the mountains mentioned.—“Smithsonian Report” (1854), p. 253.

state, and in Northern California, it gets somewhat broken up into various spurs of the Siskiyou range, and extending, by connecting spurs, far to the east, it forms the famous Sierra Nevadas of California.* It has a breadth varying from fifteen to fifty miles, and an average height of about 7,000 feet, though peaks in it have a much greater elevation. Its average distance from the Pacific Ocean is about 1,200 miles. Its main crest is crowned by several peaks of considerable magnitude, and particularly by Mounts Jefferson and Hood, and trends due north. On the northern frontier of California it is marked by Mount Pitt or McLaughlin, and by Shasta Butte, when it deflects eastward, again to be turned south at Lassen's Butte in the Sierras.† In the range are many extinct as well as active volcanoes. To enumerate all of the former would be to mention almost every summit of the range. The following may suffice as examples:—In the autumn of 1865 I visited a curious crater in the mountains between Fort Klamath and Rogue River. It lay at an altitude of some 2,000 feet, and the crater was about seven or eight miles in circumference. The walls were composed of blackish lava and reddish scoria, with pumice. Obsidian, or volcanic glass, was scattered around, being also found all over the country adjoining the mountains, where it is used by the Indians to make arrow points. At a depth of 800 feet, in the crater, was a lake of fresh water with an island in the centre. This lake is now one of the sights of Oregon. It is undoubtedly of the same nature as the Gemunder Meer, the Pulvermaar, and the Meerfelder Maar in the Eifel, and the island is only the top of that cone which we often see in craters. In Nevada Territory is another, 400 feet in length by 200 in breadth, in which no bottom has been found at 700 feet. Mount Scott presents the appearance of a truncated cone, and is doubtless also an extinct volcano. There are many peaks covered with perpetual or all but perpetual snow, for some of them are also active volcanoes. Mount Hood, 11,225 feet in height, is one of these; Mount Baker, which, in company with my friend Mr. Edmund T. Coleman, a well-known member of the Alpine Club, and the Hon. Mr. Darwin, a Territorial Judge, I attempted to ascend in 1866, but was repulsed by the Tukullum Indians encamped near its base, is another. Coleman, by dint of characteristic mountaineering skill and energy, succeeded in gaining the summit by another route after I had left that part of the country, and found its height by aneroid to be 10,613 feet. For the first time he established the presence of glaciers on the mountains, a fact previously doubted, though they are now known to be found even in the Coast range close to the sea. The mountain is a prominent object from the southern end of Vancouver Island, and is generally viewed with no inconsiderable pride by the dwellers in those parts. The chief rivers of this region rise in the Rocky Mountains, or some of its tributary spurs, and though the Cascade range gives various tributaries to the rivers which flow into the Pacific, none of them, with the exception of the Willamette, Rogue River, Chehalis, and some smaller streams, all rising on the western slope either of the Cascade or of the Coast range, can be truly styled rivers. Scarcely any.

* For a full description of the picturesque aspects of this range, see Clarence King's "Mountaineering in the Sierra Nevada" (1870), &c.

† "Pacific Railroad Reports," Vol. VI. (Geology); Russell's "U.S. Geological Survey," 1883.

of these maintain an independent existence, but unite with some of the larger rivers before reaching the sea. Vancouver Island and Queen Charlotte Islands do not possess any rivers of consequence. All of these are wild streams broken by falls, rapids, or cascades, rising in lakes or in the melting of the interior snows, and wending a tortuous course through gloomy pine forests. They eventually fall into the sea without forming an estuary. Only one river of the slightest consequence arises on the eastern or arid side of the Cascades. This is the Deschutes, which, after keeping along the base of the mountains, dashing over falls and rapids, between high walls, joins the Columbia not far from Celilo, "the drifting sand," a little sand-choked post of the railway which runs round the Dalles of the Columbia River for twelve miles. Many of these streams from the Cascades are intermittent, being almost dry in the morning, and flowing full in the afternoon. This is owing to the melting of the snow by the midday sun, and the stoppage of the melted water by the night frosts in the high elevations where their sources are. The same fact has been observed in the Rocky Mountains, and other mountain regions. Some of the rivers, like the Columbia, are exposed in portions of their course in long narrow lakes, which have received distinctive names, though in reality only part of the river which flows in at one end and out at the other. Many of them, like the Rio de las Plumas (or Feather River), a tributary of the Sacramento, and the Willamette, are subject to great floods, by the sudden melting of the snows, and frequently cause great damage, as the town of Sacramento has good reason to know. Wet seasons also are another cause of these destructive floods, the amount of rain falling in the winter being often very great.

The Cascade range is extremely important, in so far that it acts as a great barrier between two sub-divisions of the Pacific slope—the western, or maritime, which is mild in climate, and in general densely wooded, and the east, or region between the Cascades and Rocky Mountains, which is dry, cold in the winter, warm in the summer, and in general treeless, or only slightly wooded. The plants and animals of the two regions are also widely different; in fact, though they have a general likeness, yet the two sides of the Cascade range throughout its entire extent might be classed as entirely different sections of America.

The western slope is the one in which the largest number of settlements are, and that chiefly selected for the town sites. The eastern has few attractions for the agriculturist, unless in the well-watered valleys, or in places where irrigation can be applied. Gold and silver mining have been the causes which have led to the few settlements in it, but sage brush is its great feature. All of Vancouver Island partakes of the character of the western slope, though those portions of British Columbia east of the Cascades, owing to their more open character, and more northern position, are not so arid as the corresponding regions to the south. Hence the chief settlements, with the exception of New Westminster and Yale on Fraser River, are found there. The greater portion of the forest south of lat. 52° is composed of *Abies Douglasii*, the economic value of which we have already described. This tree does not extend north of the Skeena River, and south of the limits of Oregon it becomes rare, or no longer a Coast tree, the increased warmth of the more southern regions causing it to retreat to the interior mountains, where, retiring higher and higher as it

reaches further to the warmer regions of the south, it holds out an Alpine existence, having even been found in Mexico, but nowhere out of the limits of this district is it seen in perfection, or forms a feature in the scenery. It is this region with which I am most familiar, and where the scene of my researches lay for a considerable time. As I have said, the great bulk of the forest consists of the conifer named, the tree attaining its

CRYSTAL LAKE IN CALIFORNIA.

maximum of development between Vancouver Island and the Columbia River; north and south of these limits, its number or magnitude is less important. Here it forms the almost sole tree which cumbers nearly every footbreadth of the forest, growing in almost any soil, and maintaining an uncertain footing in the chinks of the rocks, where one would think it impossible to find soil enough to nourish any plant, far less a tree of its size; and it may even be found in places so close to the sea that the waves must wash its trunk and roots. In the interior of the country, a little back from the coast, *Abies Mertensiana* disputes the possession of the territory with *Abies Douglasii*, rivalling it in height and beauty, though not in economic value. The hemlock (*Abies Mertensiana*)

forest is lighter and more airy than the Douglas fir one, and the tree not branching so near the trunk, is (in my opinion) conducive to a more open and lightsome forest than the dark gloomy *Abies Douglasii*. Here is a "savage wood," which Dante might have taken for the model of that in which he found himself astray—

"——— and e'en to tell
It were no easy task, how savage wild
That forest, how robust and rough its growth."

There the only sounds which break on the ear are the *tap tap* of the woodpeckers, the drum of the grouse among the braeken or bush, or the rush of some mountain stream, which now, in the summer time, runs trickling along, but in the winter, swollen with the great rainfall of this wet region, roars through its rocky bed, flooded from bank to bank, undermining the loose soil, and carrying off with it, as a sacrifice to its fury, a perfect hetacomb of noble trees, which lie athwart its current lower down, in great drifts accumulating every year. Under the shade of these trees few living things prosper. A startled deer ambling through the forest, or a black bear crashing its way through fallen timber and crab-apple bushes to the mountains, are about the only creatures seen. Few birds inhabit the trees, and the only living things which seem to prosper are the squirrels, which feed on the seeds of the firs.

In the more open places by the banks of streams, and in rich river bottoms, the broad-leaved maple (*Acer macrophyllum*), with its bright green leaves in summer, and yellow ones in autumn, adds a pleasant variety to the scene; and the swampy places are invariably distinguished by the Oregon alder (*Alnus oregana*), and the crab-apple (*Pyrus rivularis*); while during the lovely June weather the bright white flowers of the dogwood (*Cornus Nuttallii*) are reflected in the deep pools as the traveller glides down a river in the cool of evening. Here is also found, for the first time, *Pinus monticola*, the Western representative of the Weymouth pine, but unlike it all, nowhere forming forests, but only growing in solitary clumps of two or three trees, in a few places. The gloomy foliage of the Douglas fir, and the lighter evergreen of the hemlock, are varied by the broad glossy frond-like branches, with their silver under-surface, of the Piceas. Here and there may also be found the yew (*Taxus brevifolia*), and Henry's graceful juniper (*Juniperus Henryana*, R. Br. Campst.); while the laurel-like leaves and smooth mahogany-coloured bark of *Arbutus Menziesii*, here and there, in open places, relieves the dead uniformity of the forest. Ascend the great rivers of this region in summer time, and the canoe voyager will find Menzies spruce (*A. Menziesii*, p. 161), and the cottonwood (*Populus monilifera*), shedding its downy seeds in sheets on the water, the most characteristic trees. Prairies are few. The south-eastern end of Vancouver Island, and the Willamette Prairies, are the chief open places, though here and there are other little grassy parks shut in by woods on every side. It is in these open places that Garry's Oak (*Quercus Garryana*) dots the plain—as near Victoria—everywhere eschewing the forest, and rarely found except in similar situations.

A dense growth of shrubs, consisting of huckleberry, thimbleberry, and salmonberry, and in open places the red flowery currant, now so familiar in our shrubberies, impedes the

traveller, while in the proper season the birds and the Indians are in search of the berries. Accordingly, we always find dense thickets of these shrubs in the immediate vicinity of the native villages, these bushes having been naturally planted by long generations of Indians, while the mock orange (*Philadelphus macropetalus*), the wild cherry (*Cerasus mollis*), &c., add further variety. The shrubbery is all bright-blossomed, and humming-birds flit from flower to flower in search of insects, so that these thickets are often the prettiest part of the North-Western forest; the huge pine wastes striking one with a feeling of awe rather than with a sensation of pleasure. When a storm arises the trees sway backwards and forwards, creaking and groaning, and every now and again one snaps, and the crash of its fall brings a dozen smaller ones, and innumerable branches from the neighbouring trees, to the ground, waking up the sleeping wayfarer in these forests with terror. When the thunder echoes through them, and the lightning plays down the tree, the effect is grand, no doubt; but the traveller feels that he could enjoy it better at a distance, and under shelter. During the dry weather of summer the trees, rubbing against each other, catch fire, and often great tracts of fine timber are destroyed. In the vicinity of the coast this is doubtless often due to Indians and hunters leaving, as is their universal custom, their camp-fires unextinguished; but I have often seen forests high up in the mountains on fire, and frequently come across tracts in the interior only covered with burnt stumps in localities where no human being probably ever trod before, so that I am convinced they are set on fire in many cases by natural causes.

Prairies—or breaks in this great forest—are, as we have already remarked, few. Still they are found, such as in the vicinity of Nisqually, in Washington Territory, where, however, the surrounding forest is encroaching again on the prairie, and more especially near the Willamette River, where there are extensive tracts of fine open grassy land. As we get further south the open places get more common, but in the north they are rare indeed. The southern end of Vancouver Island is one of these localities, and is often taken by the untraveller colonists as a specimen of the country. In reality it is an exception.

Such is the region immediately west of the Cascades, in the latitude of Vancouver Island, which, though not in the United States, we have, for the sake of convenience, taken as a type of that portion of the American Republic immediately south and north of it. Still further to the north, near the limits of trees, there are stunted forests, dwarfed by the chill blasts from the Arctic Ocean. The southern limit of this region is the southern range of *Abies alba* (the white fir), and the commencement of Menzies spruce (p. 161), which is found as far north as lat. $57^{\circ} 40'$, and luxuriates in the parallel of Sitka (lat. $57^{\circ} 03'$). Further south again, in the region of Southern Oregon, we find pines, such as the sugar-pine, common, oaks of another species frequent, and forming beautiful groves, while the trees are festooned with the wild Californian vine, and the oaks are hoary with a peculiar species of mistletoe. Further south we get into the forests of red-wood (*Sequoia sempervirens*), so characteristic of the Coast regions of California, but which, curiously enough, never go beyond lat. 42° , this being entirely confined to the State. Here also appear a new and characteristic group of coniferous trees (*Pinus insignis*, *P. muricata*, *P. tuberculata*, *P. Coulteri*, *P. deflexa*, *P. Bolanderi*, &c.), which are limited to the sea-coast. Among the firs peculiar to the Coast range in this region

is the Santa Lucia, or incense fir (*Picea bracteata*), which has hitherto been only found in one locality in the Santa Lucia Mountains. Various species of cypress also appear, while a new group of shrubs unknown in the North add variety to the landscape. To enumerate them would be beyond the province of a popular work. However, it may be noted that there are found the box elder, the buck eye, the Western spindle tree, the Californian lilac, and among a profusion of flowers, the silver-leaved lupine, yellow lupine, the nine bark, and a host of other species.

And here, before concluding these brief memoranda regarding the physical geography of North America, it may be proper to guard the reader against a common delusion which it is just possible my remarks respecting the different mountain ranges of the West may have served to foster. I refer to the idea that the Rocky Mountains, as seen by the ordinary traveller, form a lofty Alpine wall extending through the length of the continent. Dr. Archibald Geikie, Director of the Geological Survey of Great Britain, puts the point so clearly, and so completely as it had already struck the writer, that he may introduce the subject in his words:—"The long journey by the Union Pacific Railroad," it is the opinion of this distinguished *savant*, "is marked in the recollection of a traveller by the complete demolition of his previous mental picture of the 'Rocky Mountains.' Misled by the absurd and utterly false system, still far from extinct, of representing a watershed on a map by a continuous range of mountain chain, most people have grown up in the belief that the backbone of North America consists of a colossal rampart of mountains, which traverses the continent as a continuous range running in a nearly north and south direction, and so extraordinarily rugged as to have deserved the special appellation of 'Rocky.' No conception could well be further from the reality. To depict the American watershed in this way is nearly as erroneous as it would be to draw a lofty mountain chain from the Pyrenees across the heart of France, Switzerland, Germany, and Russia as indicative of the watershed of Europe. Such is the force of habit engendered by the long use of faulty maps, that though we knew what the true structure of the country had been shown to be, it was yet with a feeling almost of incredulity that we looked out upon the scene on either side of the railroad track as the train approached the summit of the route. The Colorado Alps had sunk down into a series of low ridges, though we could still see in the far distance some of their more notable peaks. Northward the tops of some distant hills in Wyoming loomed up on the horizon, but all round us not only were there no mountains, but hardly anything that deserved to be called a hill—certainly nothing that for a moment suggested the crest of a mountain range. The railway company, with a laudable desire for the diffusion of correct geographical knowledge, has had a board inscribed 'Summit of the Rocky Mountains,' and placed at the highest level of their line. One looks round with a feeling of disappointment for the peaks and crests that ought to have been there. Instead of these there is the same long, smooth, prairie-like slope, out of which rise numerous quaint knobs of pink granite. The central wedge, not having been driven so far upward here, forms no conspicuous feature at the surface. Yet it has carried up the same red sandstones on its eastern flank that rise in vertical bands among the cañons north of Denver. From the plain of the Missouri the prairie, there about 1,000 feet above sea-level, rises slowly in elevation westwards, till at Cheyenne, a distance of rather

more than 500 miles, its surface has an average elevation of about 6,000 feet. In the next eighteen miles, however, it makes a more rapid slope, for it mounts to an elevation of 8,271

POLLARD STATION, ON THE OLD STAGE-COACH ROUTE, LAKE DONNER, CALIFORNIA.

feet above the sea." This is no doubt a blow to our preconceived notions; but it is only as might have been expected. The Rocky Mountains are far from the sea, and the heights

which are marked on the map are of course calculated from the sea-level, not from the plain over which the train has been speeding for days before the range is actually reached. The Cascades, on the other hand, are all comparatively near the ocean, and hence their peaks show far more prominently than do the "Rockies," the sudden elevation of the range being also more marked than in the system farther east, where foot-hills break the abrupt change from gently-sloping plains to steeply-rising peaks. At the same time, Dr. Geikie is perhaps generalising on a rather narrow basis. His acquaintance with the Rocky Mountains was entirely confined to the portion seen out of the window of the Union Pacific Railway car. This line naturally takes the lowest pass possible. Farther north, along the route of the Canadian Pacific, for example, the traveller ascending from Bow River is struck by the wall-like appearance of the long line of snow-tipped peaks which lie ahead of him hundreds of miles away, looking, as they glisten in the morning sun, as Dr. McGregor describes them, like a series of "sharp-cut white pyramids built upon the prairie."

POPULATION AND PHYSICAL FEATURES.

Though we have still something to say regarding the region to the east of the Cascades before describing each state individually, the conversational character of these sketches admits of something being said in this place regarding the influence of the physical features of North America in regulating the distribution of the population, the last census of the United States (1880) supplying ample materials for much more than we can find space to speak about.* The skeleton of the United States is, as we have seen, represented by two great systems of mountain ranges, or combinations of ranges. The eastern framework is composed of the Appalachian Range, the western by the Cordilleras of northern America—a part of that great system or chain of mountains which borders the Pacific coast of both divisions of the continent, and forms its dominating and most imposing feature. These systems, which are of very different magnitude and extent, embrace between them a great interior valley, occupied by the Mississippi and the vast lakes which form so marked a feature of northern America. The Cordilleras region is sometimes divided into the Rocky Mountain section, that of the Plateaus, that of the great Basin, and that of the Pacific, all of which have been briefly touched upon in the description already given (pp. 264—6).

The Appalachian Region presents three subdivisions, the northern extending from Gaspé to the Hudson, the middle from New York to the Kanawha or New River, in Virginia, and the southern from New River to the south-western extremity of the system, each section having its own peculiar features.

The vast interior valley between these mountain systems is remarkable for its comparatively slight elevation above the sea-level and the general plain-like character of its surface. For instance, Cairo, at the junction of the Mississippi and Ohio, 1,100 miles from the Gulf of Mexico, is only about 300 feet above the sea, and at Pittsburgh, the head of the Ohio proper, we have attained an elevation of only 699 feet. One may travel up the Platte or the Kansas for hundreds of miles, rising so imperceptibly that the country appears

* "Tenth Census of the United States," vol. i., pp. xlii.—lxxiii.; Whitney, in "Statistical Atlas of the United States" (1884), &c.

to the weary wayfarer all the time one dead level, the ascent from Council Bluff to the source of Lodge Pole Creek, along the line of the Union Pacific Railroad, being on an average only five feet to the mile. From St. Paul, 700 feet above the sea, we can travel westerly for 670 miles, and yet find that at the mouth of the Yellowstone we are at an altitude of only 2,010 feet, with an average rise of two feet to the mile. The great lakes possess a combined area of 90,000 square miles. Erie, Huron, and Michigan are on much the same level, the extreme difference between the first and last named being only sixteen feet, while Superior is only twenty feet higher than Michigan, or thirty-six feet above Erie. Between the great lakes and the waters flowing into Mississippi and its tributaries the divide is in places so low that a slight amount of excavation has been required to enable waters which formerly flowed into Lake Michigan to run towards the Gulf of Mexico. Lake Ontario is, however, 323 feet lower than Lake Erie, about half the descent from the one to the other being made in one single plunge of the water which forms the famous Falls of Niagara (Vol. II., p. 213).

East of the Appalachian Range, and separating it from the sea, is the strip of country which is known as the Atlantic Plain. It comprises that portion of the United States first occupied, and is to-day the most densely-settled portion of the country. The whole Atlantic and Gulf coasts afford many excellent harbours, particularly on the New England coasts. Farther southward the entrances to the ports are narrow and shelving, and are liable to be choked up by sand drifted in by storms, and in nearly every case there is a bar across the mouth, formed by the *detritus* brought down by the stream which flows in and is prevented by the influx of the waves from carrying this *debris* out to sea. The Pacific Coast contains few harbours of any value to navigation, until the latitude of Puget Sound is reached. In the region south of this, those of San Diego and Francisco are almost the only ones of any consequence, and as a rule the coast is bluff and rocky, and the water deep immediately off the shore. About one-third of the population nestle on the Atlantic Plain, more than one-half on the interior valley, while more than three-fourths of the remainder is found in the Appalachian Region. The Cordilleran Region, owing to its recent exploration and settlement by Anglo-Saxons and the white races generally, and its distance from the continent of Europe, which forms the source whence the New World draws its colonists, contains only little more than three per cent. of the total population of the United States. Foreigners are most abundant in the Atlantic Plain, and in the interior valley there are less than the average. On the other hand, the Cordilleran Region contains more than twice, and the Appalachian Region but little more than one-half its proportion of settlers not born in the United States. The "coloured people"—that is, negroes of various shades—naturally predominate in the Atlantic plain, since it embraces several of the Southern States. In the interior valley there is also, of course, a very large number; but in the Cordilleran region—both owing to the fact that it was never a slave land, and is too cold for the coloured people's taste, apart from its distance,—there is a comparatively small number of these native aliens. Indeed, it may be affirmed that wherever the black people are abundant, the foreign whites are proportionally few, the climate suitable to the one being uncomfortable for the other; and, moreover, the rivalry between the two as wage-seekers is too pronounced to permit of them both living in the same region. Wherever the

land is low and marshy, as in the South Atlantic and Gulf coasts, and on the southern end of the interior plateau, the negro has, and is likely to have, the country pretty well to himself, for while the white sickens in a hot moist climate, the negro flourishes and multiplies.

Nearly one-fifth of the American people live below 100 feet, *i.e.*, along the immediate sea-board and in the swampy and alluvial regions of the south; more than two-fifths below 500 feet, and more than three-fourths below 1,000 feet, while 97 per cent. live below 2,000 feet. Above 4,000 or 5,000 feet, the population necessarily limited for the most part to the Cordilleran Region, is almost entirely confined to the pursuit of mining, and here, though the increase in number during the past ten years has been small numerically, it has proportionately been large. In brief, the mean elevation of the United States is about 2,600 feet, and the mean elevation of the population about 700 feet.

The country extending from the tropics north across the temperate zone, and from the sea-level to an elevation of over 14,000 feet, the mean annual temperature ranges over more than 40° , while the extreme of recorded temperature runs from 55° below zero, up to a maximum of above 115° , which torrid heat may be credited to the southern end of Florida; though in some parts of Arizona and the interior valleys covered with snow during winter there are summer days when the maximum heat is greater than in any part of the extreme south. A study of the maps produced in illustration of the last census shows that 98 per cent. of the total population lives between 40° and 70° of mean annual temperature, leaving a very small proportion to be distributed among the other sections. The entire cotton region has a mean temperature above 55° , and the sugar and rice regions above 70° , while between 50° and 60° are comprised most of the tobacco lands. The prairie region of the Mississippi Valley lies almost entirely below 55° , while the great wheat region of Minnesota and Dakota is mainly below 40° of mean annual temperature.

There are certain portions of the United States which are still almost unpeopled, or which, though long settled, are still sparsely scattered with towns, villages, or even farms. The northern portion of Maine is one of these remarkable blanks on the maps illustrating the density of the American population. Indeed, 12,000 square miles of this old State are practically without settlers. The reason is plain. Timber covers most of it, and hence farmers not caring to clear a poor soil, when better lands can be had for the asking, the only traces of man in this wide region are the logging camps of the lumbermen (p. 258) who remain there for the winter, the few little towns or hamlets near the high-ways, and the handful of enterprising summer tourists. The Adirondack Region presents so many obstacles to settlement that the central portion of it remains to-day without inhabitants. This section is very mountainous, and densely covered with forests, which, apart from the elevation of the country, and the consequently severe climate, discourages if it does not preclude agriculture. Elsewhere in the Appalachian Region there are areas very sparsely settled, but these, though large in the aggregate, are severally very small. In northern Michigan and Wisconsin there are regions of heavy forests, lying far to the north, which have, to a certain extent, been passed by in favour of the western belt of open fertile prairie, where the climate is less severe, and the toil of the agriculturist infinitely less.

But every year settlement is closing in upon these vacant spaces, for owing to the

"lumber business" being here prosecuted as the pioneer of settlement, the afforested tracts are rapidly diminishing. Parts of Minnesota are still vacant, owing to reasons somewhat similar; but with the exception of some of the western parts of the Red River Valley, the prairie portion of the State is now occupied, and settlements are yearly encroaching on the region of forests. This northern part of the unsettled region, unlike Wisconsin and Michigan, is not choked with timber, but with a scrubby growth of hackmatack (*Abies pendula*) and other brush, or by swamps and lakes. Another region of sparse settlement is that part of Georgia which includes the Okefenokee swamp, and the country extending northward, which is covered with dense jungles of southern pine, growing in a light sandy soil, forming the well-known "pine barrens."*

A large portion of Florida is also practically without settlement, in some respects owing to the direction of the general movement of population having been westward from Georgia and the Carolinas. But this will only partially account for the beautiful peninsula of the Southern States having been shunned by the human flood which has poured so steadily into regions seemingly less attractive. The lack of good harbours has, no doubt, acted as a deterrent against immigration spreading from the coast into the interior; but what has most of all to do with this fact is that a considerable portion of the peninsula is swampy and difficult of access, and

* Loughbridge in "Tenth Census of the United States," Vol. I., p. xxi.

THE MOTHER OF THE FOREST (*Sequoia gigantea*), CALIFORNIA.

consequently remote from markets. Its surface consists largely of hummocks and ridges, alternating with patches of swamp "and myriads of swampy lakes." The Everglades, according to Professor E. A. Smith, form the most singular and unique feature in Florida, and may in general terms be described as consisting of a shallow lake of vast extent, occupying a basin or depression in the recent limestone of the country. The whole bed is, however, so considerably elevated above the sea that the draining of this area is merely a question of time and expense. All the streams which flow from the Everglades are intercepted by falls and rapids, though the Caloosahatchee is navigable by steamers to within ten miles of Lake Okeechobee, where the rapids begin. The waters over the Everglades are very shallow, and teem with aquatic and semi-aquatic grass and other plants. "From this maze of water and vegetation rise considerable islands, containing from one acre to one hundred acres of land. These islands are covered with a growth of cypress, sweet bay, crab-wood, mastie, cocoa palms, cabbage palmetto, and live and water oaks, beneath which bloom flowers in almost endless variety. Notwithstanding the shallowness of the water in the Everglades, and the profuseness of the vegetation growing in it, it is comparatively pure and clear, and abounds in fish, turtle, and alligators. Bears, panthers, wild cats, and deer inhabit the islands." Lake Okeechobee has no visible outlet, except so far as its waters sweep through the Everglades; and the lands around the lake can never be made available till the waters are lowered by artificial canals.

AMERICAN IMMIGRATION.

The seekers after a new home in America ought to hold these facts in memory. The land is wide, but all of it is not fit for human habitation, and the sections suited for the residence or prosperity of the northern "European" are fast getting filled up. Still, on the other hand, it must be remembered that many tracts which are at present despised as being too far from market, or too costly to bring into cultivation, will in time be in the centre of a thickly populated country, and when labour becomes cheaper and the soil more valuable, will pay perfectly well to redeem from the wilderness. It would be easy to point to whole sections—such as Utah and many portions of Colorado—which within the memory of the present generation were regarded as utterly valueless, but, by the application of irrigation, have been rendered some of the most fertile portions of the United States. So also will it be with many of the districts indicated in the preceding pages, and with some of that dismal region which in the older maps occupied so large a space in the interior of the continent, under the name of the "American Desert." The sage-brush, always a marked feature of arid, though not necessarily of sandy soil, can easily be rendered fertile by aid of artificial watering, and the alkali tracts, glistening with nitrous efflorescence, are also not incapable of bearing crops.

To the new-comer these possibilities can, however, have little attraction. Unskilled in the arts of the engineer and the scientific agriculturist, slenderly provided with capital, with no heart for speculation, and under the bonds of necessity to provide a home and a livelihood for himself and his family, the immigrant must, at least in the earlier days of his sojourn, devote his attention to a farm which will yield its return in the old-fashioned way and with

the old-fashioned appliances. If such an individual is anxious to "take up land" by the process of "pre-emption"—that is, by occupying the one hundred and sixty acres of State territory which, under certain conditions, every citizen or naturalised citizen is entitled to do—he will find this operation no longer as easy as it was a few years ago. There is, of course, still soil in abundance, and will be for a great many decades to come. But the best land, and that most advantageously situated, is, both in Canada and the United States, either occupied by actual settlers, or held by speculators or railway companies, who part with it on terms not quite so easy as those fixed by the Government either at Washington or Ottawa. The majority of emigrants who seek to "do old deeds in countries new" are, however, little fitted to battle with the grave difficulties which must be encountered by every one who essays to build a "lodge" in any wilderness—vast or otherwise—and to make the virgin soil blossom with a crop, more especially if, as not unfrequently happens, some stubborn scrub or still more stubborn timber has to be removed before that desirable end is attained. Happily, therefore, for the emigrant from Europe provided with a modest amount of capital, there are always plenty of improved farms to be bought in the older districts, which are in the market, either owing to the circumstances which cause every kind of property to change hands anywhere, or on account of the tendency which the native American settlers have for "moving west," the difference between the price of their old and their new homestead being to them a "welcome" accession of capital, with which to commence life anew. More especially of late years has this been the case in the New England and other eastern States, and in the older provinces of Canada, from which there has been a perfect "rush" into Manitoba and the north-west. In the case of New England the migration has been into the Western States, which possess richer and cheaper soil than can now be obtained in the thickly settled and comparatively sterile portions of the older parts of the Union. Moreover, it may be added, the "competition," regarding which we hear so much in Europe, affects, as regards wheat, the New England and other eastern sections, more than it does England; for, of course, the sea freight is a "protective" item which is not enjoyed by the farmers of Massachusetts and Connecticut, into whose markets Iowa and Minnesota are every autumn pouring, often at little profit to themselves, their surplus crops of grain.

So far as the natural advantages presented by Canada and the United States respectively are concerned there is not much of a choice. Both enjoy a wide range of climate and soil, though naturally, owing to the greater latitudinal extent of the Republic, the temperatures through which a traveller may pass from the Great Lakes to the Gulf of Mexico without once leaving its soil, are more varied than he could experience in Canada, despite its breadth, and the fact that it stretches from among the vineyards of Ontario and the dwarf cactus of British Columbia to the mysterious solitudes of the Polar basin. The heat of some parts of Canada is torrid enough during the heyday of summer, and there are portions of the interior valley of the United States which "enjoy" the pleasure to be extracted out of a winter temperature which is sometimes quite as severe as that of Disco Island. As a rule, however, the winter of even the coldest of the western States is shorter than that of Manitoba, which is unquestionably not to be recommended to settlers who do not delight in summer droughts or five months of what may, with all respect for the susceptibilities of those who

cannot be expected to be altogether impartial when the good name of the Prairie Province is at stake, be described as particularly severe weather.

The rest is a mere matter of choice. The United States are in effect a cluster of semi-independent republics, each of which has its own constitution, laws, and mode of government, and in nearly every instance two houses of Legislature. The federal or general government, administered in Washington, exercises a limited control over the individual States, and a more

THE CALIFORNIAN QUAIL (*Lophortyx californica*).

special one over the territories, which are States in embryo or transition. In these the governor and most of the principal officials, including the judges, are appointed by the President. though in most other respects the territories have the privilege of self-government. The Federal Government holds the public lands in its own hands, and has the control of the army, the navy, the post-office, the foreign relations of the country, the Indians, the customs, the supreme court, the coinage, &c.; though every State has, or ought to have, its own militia, the official commander of which is the governor elected by the voters. Each State sends representatives to Congress, which is composed of the Senate and the House of Representatives—the latter being elected by universal suffrage, in the proportion of one member to every 135,239 people, each for two years; the former by indirect vote of the

local Legislatures, two for each State for a term of six years. In like manner the President and Vice-President (the latter of whom presides over the Senate) are chosen by an electoral college, composed of presidential electors voted for by the people at large.

INDIAN CHIEF OF NORTHERN CALIFORNIA, AND FAMILY.

In general terms it may be said that the system of government in Canada (p. 213) does not differ very widely from what obtains in the United States over the border, except that it is somewhat more aristocratic, and accords greater power to the Federal Government. The Viceroy, or Governor-General, is appointed by the Imperial Govern-

ment, though paid by Canada, but the provincial Lieutenant-Governors are nominated by the Governor-General or, actually, by his ministry, which, like the English cabinet, exists by the confidence of Parliament. Each province has its own legislature popularly elected, but the judges and other great officials are not elected. The provinces receive stipulated subsidies from the Federal Government, which of course holds the customs, militia, &c., in its own hands. Each province also sends representatives to the House of Parliament in Ottawa, but the Senate consists of members who are appointed for life by the Crown on the nomination of the ministry. In most other respects the Dominion and the Republic are very much alike, though the former claims that the constitution of the latter does not give the people such complete control over the Government—central and provincial—as does the system which obtains in that all but independent “Dependency.” This is, however, a matter of opinion. Justice, liberty, and good order are certainly every whit as well attended to in the most remote parts of the Dominion as in the oldest sections of the Union, and to a fresh arrival from the staid, sedate kingdoms of Europe there is a pleasure in finding that by crossing the sea he has not relaxed those bonds by which society is kept from disintegration. To a Briton there is in Canada the additional advantage that he is at home. He requires to take no oath of allegiance, and even a foreigner can hold real estate without being naturalised, and when, after three years’ residence, he desires to become a British subject, he is not asked to make any offensive renunciation while taking upon himself fresh vows of fealty to the land which shelters him and his family. Altogether, an Englishman would feel in Canada less strangeness than in the United States, many portions of which, even those where the English language is all-predominant, are foreign countries, in manners, modes of thought, and prejudices, to a person who has lived to manhood among the subjects of Queen Victoria. It may be added that in every particular the land laws of Canada are as liberal as those of the United States; in some respects they operate even more favourably in the interest of the settler.

More than this it is perhaps needless to say, as each State and Territory is described individually. According to the Census of 1880, the entire Republic contained—exclusive of Alaska and unsettled Indians—50,152,866 souls, the increase in the ten years since 1870 being 11,594,495. Its debt—and the debt, it must be remembered, is quite exclusive of that of the individual States—was £301,894,404, which is being reduced at the rate of about £30,000,000 per annum. In 1882 the federal revenue was £80,705,050, and the expenditure £51,394,085. The army is under 28,000 men and officers, and the navy, though consisting nominally of 140 vessels, is actually in a very unsatisfactory condition considering the vast line of coast to be protected.

There are at present thirty-eight States and nine Territories in the Union, to which must be added Alaska, and other unorganised Territories. The States are usually classified as follows:—*The Eastern or New England States*, comprising Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, and Connecticut, and to them the familiar term “Yankee” is strictly applied. New York, New Jersey, Pennsylvania, Maryland, West Virginia, and Delaware, are the *Middle States*. Virginia, North Carolina, South Carolina, Georgia, Florida, Alabama, Mississippi, Louisiana, and Texas, are the *Southern States*. The *Western* are Arkansas, Tennessee, Kentucky, Ohio, Michigan, Indiana, Illinois, Missouri, Iowa,

Wisconsin, Minnesota, Kansas, Colorado, and Nebraska; while the *Pacific States* are California, Oregon, and Nevada. The *Territories* are the Indian Country, New Mexico, Wyoming, Dakota, Montana, Idaho, Utah, Arizona, and Washington.* Alaska, as we have already remarked, is unorganised; while the District of Columbia, as we shall see by-and-by, is, after many changes of government, ruled by a kind of constitution which may be described as a hybrid between a congressional protectorate and a benevolent despotism. The Americans are, however, fond of nicknames. Accordingly the reader of trans-Atlantic newspapers may be sometimes puzzled by finding the different sections of the Union designated by titles which are not to be found on the maps. For example, the people of Alabama are, in the easy, every-day political vocabulary of their neighbours, lizards; those of Arkansas, toothpicks; of California, gold hunters; of Colorado, rovers; of Connecticut, wooden nutmegs; of Delaware, blue hens' chickens; of Florida, fly-up-the-creeks; of Georgia, crackers; of Illinois, suckers; of Indiana, hoosiers; of Iowa, hawk-eyes; of Kansas, jayhawkers; of Kentucky, cornercrakers; of Louisiana, ereoles; of Maine, foxes; of Maryland, craw-thumpers; of Michigan, wolverines; of Minnesota, gophers; of Mississippi, tadpoles; of Missouri, pukes; of Nebraska, bug-eaters; of Nevada, sage hens; of New Hampshire, granite boys; of New Jersey, blues or clam-eaters; of New York, knickerbockers; of North Carolina, tarboilers and tuekoes; of Ohio, buckeyes; of Oregon, web-feet and hard-cases; of Pennsylvania, leatherheads and Pennanites; of Rhode Island, gun-flints; of South Carolina, weasels; of Tennessee, whelps; of Texas, beef-heads; of Vermont, Green Mountain boys; of Virginia, beattles; and of Wisconsin, badgers. In like manner, and perhaps for reasons quite as trivial or as reasonless, the Canadians are universally known as "Kanueks," while the people of Nova Scotia take something akin to pride in being designated by the title of "blue-noses," a name which is understood to refer to their "blue-nosed" potatoes.

In the chapters which follow we shall, however, travel round the Union in a somewhat less systematic manner, and therefore before beginning to describe the Pacific States, it may be advisable to say something regarding the Pacific Slope generally.†

* In the Census Report a slightly different classification is adopted. I have, however, preferred the older, simpler, and more generally accepted arrangement.

† Those who desire a fuller account of these regions may consult the works quoted in these pages, and the magnificent Reports of the Geographical and Geological Surveys of the Territories, under the direction of Dr. Hayden and Major Powell; and to the "Geological Survey of California," under the editorship of Professor Whitney, which may be accepted as the best guide to that region, without the reader accepting every theory, especially that on the non-glaciation of British Columbia, formulated by the learned professor, but which is entirely unsupported by other geologists, and, worse still, by facts.

CHAPTER XV.

THE UNITED STATES: THE PACIFIC SLOPE.

THE region between the Cascades and the Rocky Mountains is very different from that between the former range and the sea. Towards the north it is not so distinct from the other side of the mountains as further south, the amount of moisture in the former district approximating the two. Immediately south of Fraser River, a little cactus (*Opuntia*), which creeps on the ground, is one of the most characteristic plants, and this attains its northern limits about the Fraser. The country is thinly scattered with *Pinus ponderosa*, which, here and there, form park-like regions, while a *Juniperus* and a few oaks are also here and there found. Easterly it is bounded by a great basin or desert which lies beyond the influence of the moisture of either the Cascades or Rocky Mountains. Most of the finer plants of this region have been introduced in our gardens by Douglas, Jeffrey, the author, and others. In the vicinity of the Kootanie are some beautiful prairies, and altogether this region is an infinitely more enticing one than that on the other side of the Cascades. Further south, however, the country is by no means so inviting. Whole tracts are without water, and often leagues are covered with lava or volcanic debris. The black pine (*P. contorta*), which is also found on the sea-coast further north, thinly clothes considerable tracts, even where there are no springs, while the moister regions support *P. ponderosa*. The sage-brush, however, frequently tells the tale of a thorough desert. A sage rabbit (*Lepus artemisia*), a coyote wolf (*Canis latrans*), a prairie chicken (*Pediocæetus phasianellus*), sage fowls (*Centrocircus urophasianus*), an antelope (Plate VI.), a mule-deer, or worst of all, a half-naked Shoshonee Indian, bounding out of some rocky cañon with a demoniac yell, are nearly the only creatures to be seen, unless, indeed, we add rattlesnakes, which make the vicinity of a camp-fire hereabouts by no means agreeable to a nervous man, who has, however, no business east of the Cascades. Towards the southern portion, *Juniperus occidentalis* (the Western juniper) is about the only timber on the bare hills, and upon this the soldiers sent to check the marauding Indians have to depend for timber, though, indeed, sometimes this failing, recourse has to be had to the sage-brush, which gives out some degree of heat, though it burns up like a wisp of straw. Further south, the country becomes even barer—an utter desert—"a waste and weary land, where no man comes or hath come since the making of the world." Some parts of the district, such as the great plain of the Columbia, are entirely without trees. A little way above the Dalles of the Columbia River stands, or at least stood, a solitary pine, generally known to the *voyageurs* of the fur companies as "Ogden's tree." This was the last tree for fifty miles. All of the plains between the Rocky and Cascade Mountains are not, however, uniform. Here and there are spots—oases in the desert—with a vegetation different; owing to moisture and other causes on the Blue Mountains, and other similar ranges in this district, we get forest when we reach a certain elevation, if the height of the range be sufficient to intercept any of the moist breezes from the Pacific, which the Cascades usually precipitate

MAP OF THE UNITED STATES, MEXICO, ETC.

before they can reach this treeless eastern region. This country gradually merges into the Colorado Desert; but of this we may have something to say by-and-by, and will, therefore, not confuse the reader by describing it in strict physio-geographical sequence. Perhaps he who runs may read, in the following outline of a journey I made into the region immediately east of the Cascades, more information in a less severely didactic form about it than from a mere dry description. As a contrast, therefore, to the sketch in the preceding chapter, I need not hesitate to give it.

EASTERN OREGON.

It fell out in the halcyon days of '65, that I was roving to and fro—a plant-hunter in the Rocky Mountain slopes—into this valley, and out of that, up one mountain and down another, now staying at a hospitable little Western settlement a few days, and after recruiting, diving once more into the wilds, trusting to my usual good luck that I should come out with a whole skin. In the course of these wanderings, I landed by devious paths in the little village of Eugene, in the State of Oregon, not far from the head waters, and at the height of winter steam navigation of the Willamette River, a tributary of the Columbia, on which is situated Salem, the capital, and still lower down the larger and more thriving town of Portland. It is now a station on the railway; but in those days there was no railway in Oregon, except twelve miles around the Dalles of the Columbia, and Eugene was a somewhat primitive place, though fresh and cheerful enough when one got familiar with it. A Methodist “meetin’ house,” and a big white painted hotel, were the chief buildings. The female portion of the population went to the former, while outside the latter, from “morn till dewy eve,” there was always seated a by no means select body of citizens, whittling sticks and chewing tobacco in a ruminating and solemn manner. Nevertheless, Eugene and the Eugenites, with their pretty little one-storeyed wooden houses scattered over the prairie-like expanse of village, with the tall fir-trees around, and the river flowing past, had an excellent opinion of themselves.

Eugene boasted of two papers, the *State Journal*, devoted to the interests of the Republicans, and the *Review*, an equally violent Democratic partisan. Now, every other day these rival sheets announced “Lieut. John M. McCall’s Co. A, 1st Oregon Cavalry, would shortly leave for an expedition east of the mountains, as an escort to Pengra and Oddel, who are about to locate a military road to the Owyhee country, and at the same time act as an escort to Mr. Superintendent Huntington, who was to meet the Snake Indian chiefs, in order to endeavour to form a treaty of peace with them.” These military gentlemen, in company with the empty stage-coach which rumbled once a day into Eugene, formed the chief items of sensation to the sleepy little place.

Now, to “John M. McCall,” as the gallant lieutenant was widely known, I had a special letter from the Governor of Oregon, enjoining on him to show me what attention lay in his power; and finding that it was my intention to attempt to penetrate alone into the country to the east of the Cascades, I was strongly advised that if I valued my scalp, I had better accept the escort of “Co. A” on their proposed expedition. Accordingly, on the 17th July, our whole party left the little frontier village, amid the cheers of the “loafers,”

who sat chewing and whittling in the hotel "stoup," and the regrets of the fair Engenites. I overtook the party in the evening, encamped a few miles out on the M'Kenzie fork of the Willamette, under some pleasant maple trees, with droves of horses grazing around, cattle for our own consumption herded on the prairie, and the quartermaster busily making out "forage warrants" (for we had not yet quite left civilisation, as this abundantly showed).

The scene looked quite like a Tartar encampment, and I could not help remarking the difference between English and American officers; that while the former going on an expedition of this nature would have provided all sorts of impossible apparatus and wardrobe, usually supposed to be necessary to gentlemen of the British Isles when they go "roughing" it out of sight of their homes, these worthy Western men, accustomed all their lives to such journeys, had not deviated one whit from what they would have worn down in the settlements, and appeared here at the base of the Cascade Mountains, on the eve of undertaking a long summer's expedition into the outer world—even of Oregon—in all the accustomed glory of white shirts and standing collars, alarming ties, and that shambling slipshod style of uniform that Transatlantic *militaires* delight in on all occasions, be it in Washington or on the Willamette.

Discipline can scarcely be expected to be found in great perfection among a mob of soldiers hastily "seared up" on the Indian frontier, every man thinking himself as good as the President, or his colonel; but, nevertheless, everything went on very smoothly, and if even a private did occasionally address his commanding officer by his Christian name, requesting at the same time the favour of a chew of tobacco, why, no great dignity was sacrificed, and no great harm was done.*

For two pleasant days our route lay among the outlying settlements of the Willamette, among rounded knolls, or as they are called here "buttes,"† with neat little primitive farms, at the base of rocky bluffs, where rough voices hailed us cheerily, and shouted to us to "take care of your *hur!*" an advice no doubt tendered in the kindest spirit, but sounding rather unpleasant to men perfectly familiar with the whole *rationale* of the Shoshonees' scalping-knife!

The country was well watered and well wooded, and many were the roaring mountain creeks we had to cross or swim "when ford there was none." Our daily routine was much the same. At daybreak the bugle sounded the *réveil*; all commenced to pack up, and the cooks to prepare our modest breakfast, of which the inevitable pork and beans formed the staple. The horses were then driven up, every man lassoing his own and saddling it; for no horseman of the West, be he captain or private, would ever think of allowing any one else to do it, knowing well that a wrong adjustment of the blanket, or a girth too much or little, may cost him his life—or what is just about the same thing—his horse. The mules were then packed with the usual ejaculations in Spanish and English, for muleteers declare that the nature of that animal is much

* Two of our muleteers were half and quarter castes, respectively the grandson and son of Pierre Dorion, whose name and deeds have been celebrated in Washington Irving's "Astoria."

† A useful French-Canadian *royageur's* term to express a rounded elevation too low for a mountain, but too high to be called a hill. This distinction is, however, not strictly adhered to, e.g., Shasta Butte (more than 14,000 feet).

too demoniacal to do anything without using towards it (to speak mildly) very bad language. These ejaculations are generally nicely graduated—carambo! carajo!! madre de dios!!! sacramento!!!! diabalo!!!!!! Such soft “Castilian words” coming floating to

VIEW OF THE CAÑONS OF THE COLORADO.

your ears upon a calm summer evening in some silent mountain valley, have decidedly a fine effect! Then came up in the rear the cattle herds.

Our march was rarely prolonged beyond midday, though we often halted much earlier, to allow of the overloaded train resting for the grass, or for convenient camping places. We spent the rest of the day reconnoitring the neighbourhood for plants, fishing in the mountain streams, hunting deer through the long dark wooded dells, or in sleeping under

a bush, each as his own individual *penchant* inclined him, the bugle calling us back to camp for supper, which was served on the military chest. The evening was spent, until dark, telling round the watch-fire tales of our former adventures, or those "bear and rattlesnake" stories for which the Western frontier is so notorious, after which each

SNAKE INDIANS OF OREGON.

man rolled himself in his blanket, under his own particular tree, with the stars for our lamps and the sky for a canopy, until the cheery bugle again woke us at daybreak to make our toilet in those gray misty summer mornings by the banks of some nameless stream, and then to resume our happy march further and further from the haunts of civilised man, from the country of the little known into that of the still less known. The widely scattered "clearings" became fewer and fewer, until a "claim shanty," consisting of a few logs raised in the middle of a "land claim," to fulfil the bare

letter of the law, was the only appearance of the tide of civilisation having flowed thus far. The road (such as it was) became worse and worse. Then we rode through timber and in sight of the middle fork of the Willamette, gliding along between wooded banks of pine and cedar, and the maple in its summer green, when we suddenly emerged upon a pleasant encampment, with tools and cooking utensils and tents scattered around; but like the camp of the Assyrians, all was vacant. Soon the party began to return. They had been out gathering berries for more than a week, a favourite sort of picnic party among the simple-minded people of Long Tom Creek, and used (under the supervision of some grave senior) like camp-meetings, without the preaching, by the young people of those primitive sections for much the same purposes as garrison balls and flower shows are by those hailing from better-known places on this side of the *blast* Old World. As the young men and elders of the party emerged from the bush, bearing deer from the mountain, grouse from the woods, and strings of speckled trout from the creeks, and the prairie belles, bearing baskets of the yellow salmonberry, the huckleberry, and the strawberry, some of us could not help thinking that they do things much better here than in France.

With certain misgivings that we had made a mistake in leaving civilisation we crossed the river, passed the last frontier house, killed a rattlesnake (*Crotalus lucifer*, Baird) * which was coiling itself up inconveniently near to where we were about lying down, and wrote in our journals that we had ridden seventeen miles through cultivated valleys, well watered and wooded, but that we were now in the wilderness. No longer was our eye refreshed with a sight of a sunburnt frontier damsel, wild as a deer, but with a refreshing innocence of cities. How severely the loss was felt may be imagined when a trooper declared that "He'd give a barrel of whisky for the sight of a gull!" On the 19th, after travelling for a distance of six miles through cañons and thick woods, over many small creeks, by the banks of the river, with no cultivation, though good spots here and there, we met three Indians returning to the Siletz Reservation from Mr. Simpson's party, which was a little ahead, and who informed us that we could encamp on a small prairie thinly scattered with timber and separated from the river by a piece of rich timbered land. Here we found an old hunter's log cabin, and accordingly christened it "Cabin Prairie." Next day our route lay through dense timber, and after passing Mr. Simpson's party of Indians making a trail, we had to drive our horses before us, scrambling over fallen trees and among rocks, up steep inclines, until we came to a point which was named "Point Look-out," where we had great difficulty to get our horses over, and where we lost one mule in the river. Here we encamped, driving our horses across the river, but little or no pasture could be found, and we spent a portion of the day cutting grass with our knives for them. The next eight miles was through wooded river bottoms, when a party went ahead to clear some of the worst impedimenta, swam the river again, climbed a steep mountain trail (for we were now entering among the foot hills of the Cascade Mountains), and emerged into a beautiful prairie valley shut in by mountains, but covered with grass, a good creek flowing through it,

* Rattlesnakes are usually said not to come to the west of the Cascades. I have killed them frequently in Lane county, Oregon, and similar country.

and with shady woods on the border, so that one might fancy himself in the "Happy Valley" of "Rasselas." It was totally uninhabited, save by a very curious dilapidated horse, which the drummer-boy rode all the afternoon. This forlorn brute was covered with something, scarcely hair, and accordingly we set it down as the famous woolly horse which Barnum exhibited as having been captured by Fremont in this region.

Tradition, however, lingers in the Valley of the Willamette, that once upon a time a half-savage Missourian and his three sons came here, and found a few renegade Indians, whom they managed, with the help of the Klamath Indians, to "civilise off the face of the earth," hunting them in the valley with their rifles as if they were wild beasts, and then appropriating their squaws. We could see their houses and the remains of the Indian lodges, but where they had gone to we had no opportunity of learning. We were, however, led to believe that they were concealed somewhere in the woods until our departure. During the next two days the country was pretty similar, and we encamped (after travelling five miles) on a little prairie, so delightful a scene that it set us wishing for "that lodge in some vast wilderness," which most of us, after passing so many lonely years wandering among the Indian villages of the North, and in solitary encampments, had got over. The trail therein lay through woods of fine timber—white cedar (*Thuja gigantea*), red cedar (*Libocedrus decurrens*), and we now noticed, for the first time, the stately sugar pine (*Pinus Lambertiana*), with the sweet exudations from which it derives its name, and which is one of the huntery cathartics. A rhododendron and a honeysuckle (*Lonicera Douglasii*) added variety to the sombre woods, hitherto only diversified by an undergrowth of berry bushes—the bright salmonberry flowers (*Rubus spectabilis*), and the more modest thimbleberry (*Rubus Nutkanus*), and the waxy sal-al (*Gaultheria shallon*), forming an undergrowth like a carpet throughout the woods—a sure sign of poor stony ground. The stately alder (*Alnus oregona*), with its dark green leaves, affected moist ground everywhere, in company with the hemlock, most graceful tree of all. This North-Western conifer began to disappear from the woods, the silver fir (*Picea grandis*), supplying its place. Now and then we would break through thickets of the mountain laurel (*Ceanothus velutinus*), sending an almost overpowering fragrance from its glistening leaves as we trampled it down under our horses' feet. Amid these pleasant scenes we had a day of disasters—two mules with their loads had rolled over a precipice and were dashed to pieces, and another, after rolling end over end (after the manner of mules), had survived and packed its load into camp. Part of the loads was recovered, but a side of bacon up a Douglas pine-tree will remain as a monument of the passing of the first expedition through these mountains. Some emigrants had attempted it in 1853, and we could yet see remains of their disastrous trip, in which several of them died of starvation. I have seen some of them in the Valley of the Willamette, and they used to declare that in the bed of a creek they saw a metal which they were sure was gold, and parties even went out to search for it, but did not find it. It was, they said, "in chunks as big as hen's eggs," but we had all been too long on the Pacific coast to believe such tales, generally classifying them with the proverbial "bear and snake stories." Our track had hitherto been always in general in the south-east direction, and to-day it lay by the banks of the Middle Fork, seeing little but the woods and forest-clothed hills of the Pass. We frequently noticed "sign" of bears, wolves, and panthers. Deer were seen, and

trout abundant. The rocks were all volcanic (trap), and the soil sandy, and with the exception of the wooded river bottoms, rarely fit for cultivation. We encamped in an open space in the woods, with good pasture, but of small extent, and the soil stony and poor. We had gone ten miles, and named the camp the "corral" (a Spanish term in common use on the Coast to signify an enclosed place for horses). We saw around here many Indian bough encampments, but apparently old, and remnants of days long gone by, when the Indians used to come hunting here. I had here the misfortune to lose my horse, and after vainly following his trail, mounted behind a good Samaritan, hoping to meet some Indians and purchase another. We travelled fourteen miles before camping, over a fair track with a good creek portion of the way, and latterly leading over a country with many steep places, where we had to ride by an almost perpendicular path. In one of these wooded gulches we met a number of Cynse Indians and a white man, all dressed in most gorgeous array of buckskin and beads, crossing for horses to the Willamette country, and as we emerged into the "pine opening" a hill-track, covered with good grass, and thinly scattered with yellow pine (*P. ponderosa*), I was delighted to again recover my faithful horse, which had been found by the rear-guard. The scenery was here very fine—on every side bold wooded mountains, with the head-waters of the Willamette sparkling between the trees, and the snows of Diamond Peak in the distance. After every preparation had been made, we commenced the passage of the Cascades into Eastern Oregon. The ascent was comparatively easy, crossing over many mountain creeks, through woods, where I saw many trees of a species of yew (*Taxus brevifolia*), until the elevation began to be perceptible in the flora. Plants which were long ago in fruit in the valleys were here in partial flower, while on the summit they were in full bloom. Thickets of rhododendrons (*R. maximum*), with their huge bunches of pink flowers, stood out in fine contrast to the drifts of snow, giving one a faint idea of the splendid rhododendron thickets of Sikkim, Himalayas, so graphically portrayed by Sir Joseph Hooker. Occasionally a magnificent species of mountain lily would bloom by the side of some beautiful saxifrage, and the shrubbery of the ceanothus would add fragrance to the mountain air. The scene from the summit of the pass (4,441 feet) was grand in the extreme. The bold snow-covered crags of Diamond Peak, with its old crater, and the "Three Sisters," appear to the north, and on the left, away to the south, the tops of Scott's Peak and Mount Williamson, while the wooded valleys and lesser heights of the Cascade range lay below, and off to the east appeared the long slope of flat-wooded country, with the peaks of the "Three Brothers," the only break in the monotony of the view. Drifts of snow lay in shady places, and green grassy spots formed halting-places by the side of mountain streams. Now and then a beautiful mountain lake, unsuspected before, lay glistening in all its quiet beauty in some unbroken valley. As we began the descent, a marked change was apparent in the country. Instead of moist woods, our route lay by an easy descent through groves of pine thickly scattered over that country (*P. contorta*), encumbered with no undergrowth, and the soil a mass of volcanic ashes and pumice-stone. At two p.m. we were right glad, after a weary ride of twenty-six miles, to reach the head-waters of the Deschutes, or Falls River (lat. 43° 27' 22" N.), here only a little creek meandering through a world of rich grassy meadows—a sort of "horse heaven"—but with little of the characteristics which

VIEW IN THE ROCKY MOUNTAINS (COLORADO).

it possesses near its mouth. This river lower down flows through high cañons—along the banks of which you may be dying of thirst, yet fail to reach the water—and falls into the Columbia about eighteen miles above the Dalles. Deschutes River arises by several forks, some of which take their source in the marshes, another in a lake, which we named "Summit Lake" (which we had seen on the right hand descending), that communicates by a small creek with another sixteen miles in length lower down (named "Crescent Lake"), and this is again connected with a third among the mountains, styled, in honour of one of the party, "Lake Oddel." Our camp* here was 1,200 feet below the summit, and though cold at nights, the mosquitoes in the early portion of the evening were very troublesome. Chipmunks (*Tamias Townsendii*) were very abundant here, and so continuously "popped" at, that I verily believe they even yet come out of their holes in the expectation of finding a pistol-bullet aimed at them. Herons, cranes, and grouse were plentiful near the river, but otherwise few birds were seen in this solitary region. As our provisions did not come up for two days, we provided ourselves with trout, which were caught in great abundance by hooks baited with field-cricket or "grasshoppers" (*Acheta nigra*), an insect abounding all over the eastern side of the Cascades, and as a pest almost equal to locusts. The winds which every now and then sweep over this desert-like tract will blacken the rivers and lakes with them, and the miserable Digger Indian draws the main portion of his substance from these insects.

On the 29th of July we began to direct our course in a E.S.E. direction, over a level desert flat, with a soil composed of volcanic ashes, and thinly scattered with a forest of *Pinus contorta*, a scrubby looking tree at best, abounding in resin. To the E. and N.E. lay a long stretch of flat land, probably ninety miles in breadth, of a similar character to this, but which we found to be impracticable to traverse, on account of the almost entire want of water in it; the creeks flowing from the Cascades sinking into the sandy soil before flowing far into this desert tract. Mr. Thompson attempted to explore it, and though he carried water portion of the way, both he and his party suffered fearfully. Pah-nine, the celebrated war chief of the "Snakes," told me that after the battle in which Lieut. Watson was killed he traversed this waste. "I determined," he said, "never more to fight against the whites, and separated from my brother, We-wow-weya, and hoped to flee to a country where the white man could never reach me. So I took my horses and my men, my squaws and my children, in the direction of the dying sun, and went over the dry country between there and *Queyia* (Deschutes River), filling the stomachs of antelopes with water, *for there is none there*, and I came to a valley where my men hunted and my women gathered berries, and I thought that the whites had forgotten me, and that I was safe. But, when I came back one night to my lodges, the fires were out, my warriors slain, and my women and my little boy taken prisoners. My heart was sad, and again I fled, wifeless and childless, poor and hungry, with no food for the winter, with none to dress

* According to the "Pacific Railroad Surveys" (Vol. VI., Appendix C., p. 29 of Appendices), Deschutes River is 4,411 feet above mean tide at Benecia, California. I presume their observations were taken at the same place as ours. The other altitudes on our route were as follows:—Klamath Lake (lat. 42° 17' 10" 2 N.), 4,180; Klamath River (lat. 42° 31' 31" 4 N.), 4,196; Klamath Marsh, 4,512. This latter observation, taken from the same authority, differs much from ours, as do most of them. See also Goad: *Proceedings of the Royal Geographical Society* (1878), p. 695.

my deer, with none to make, with none to cook, my food. I was poor after I fought with the whites, for you burnt up my dried meat and my ammunition, and took away my horses; but now I was poorer than ever. My people said, 'Let us go to We-wow-weya, who has gone to join Hálluck at the rising sun, and band together against the whites; we can but be killed.' But I said, 'No!' and all winter I lived by the border of Silver Lake, killing my horses for food, and my heart was sad and weary, until the warm days came again, but still I hunted and lived poor. You see I have no horses, and how miserable we are. I would not go against the whites, for I was sick of war, and blood, and scalps, and so we hunted the elk and the antelope, and gathered *wocas*,* and *gamass*,† and *kous*, and got trout from the lake, until Huntingdon's messenger came telling me to come and make peace, but my young men on the hills saw the soldiers were coming, and said they would be killed, but I knew that Huntingdon would not tell a lie, and so I came weary and ashamed on foot." I have given this extract in order to show the character of the people we were entering among, but more particularly for the geographical data it affords.

The "Three Brothers" are the only breaks in the nearly level landscape in that direction, and the snow peaks of the Cascades gleaming through the trees, diversify the view to the right, and now and then a cool breeze tempers the hot summer's day as we slowly in long file traverse this arid tract. There was no undergrowth in the groves of pine, but here and there occasionally bushes of the wormwood, or as it is universally called, the "sage" (*Artemisia tridentata*), so characteristic of the whole of the country we were now entering, began to appear, and with the exception of the "black pine" formerly mentioned, a few sugar pines, and one not unlike it in foliage (*P. ponderosa*) there was no timber. After a march of eleven miles, we halted on a branch of the Deschutes River, where we found a tolerably good stretch of meadow ground in the immediate vicinity of the river. Deer were plentiful, and the beautiful little humming-birds flitted about among the few flowers which the invigorating moisture allowed to spring up here and there among the long swampy grasses. A journey over these wastes, though interesting from a topographical point of view, is yet to a "general reader" about as entertaining as the time-honoured sea journals kept by the mates of merchant vessels, wherein is recorded with minute accuracy how the wind "in the first part of these twenty-four hours was E.N.E. $\frac{1}{2}$ E., and how in the second portion it was ditto, ditto, and in the dog-watch ditto, ditto, the boatswain's hands employed as before, ditto, ditto, the tradesmen at their trades, and the hands employed variously; lat., by dead reckoning, so-and-so." But the exigencies of geography requiring such, more especially since so little can be said, the readers will pardon me if for the next five days I trouble them with a somewhat monotonous narrative. The track continued much as before, only more hilly and varied, more sugar-pine, and the country more open; and so for sixteen miles, until we came to a creek named "Miller's Creek," with good water and a little grass, in the prairie-like openings near the river.

Hitherto, though a sharp look-out had been kept, we had seen no Shoshone Indians, but this evening our scouts came in with very long faces, describing the "great mocassin" tracks crossing our trail after we had come into camp, and as every one knows that this

* *Nuphar advena* (Ait).

† *Gamassia esculenta* (Dougl.).

311
was the "sign" of that tribe, we slept with only one eye shut. Indeed, though we could obtain no sight of our pursuers, yet it was only on arrival at Fort Klamath that we learned from the Indians there that we had been dogged by three lodges of "Snakes" the whole of our journey, seeking an opportunity to stampede our horses, or capture an odd scalp or two when it could be done without the disagreeable accompaniment of running their heads

THE BLOOMER CUTTING ON THE UNION PACIFIC RAILWAY.

against a leaden bullet. Once, as we crossed Fremont, the "Pathfinder's" trail, the tracks of mocassins and "barefooted" (unshod) horses, with camp-fires not extinguished, began grievously to alarm us, and to suggest very serious jokes about the period of time we should be favoured with the possession of our individual scalp-locks. However, we afterwards found that we were unnecessarily frightened: it was only the Superintendent of Indian Affairs for Oregon, on his way with his band of Cyuse scouts to try and make a treaty of peace with Pah-ni-ne. The next day, travelling over a similar country, only with more open spaces and finer trees, we came to a spring gushing out in the form of a large creek from the ground. Fremont doubtless mistook this for the great Klamath Lake, in his

expedition of 1843-4, and the river, which I have mentioned as permeating it, he thought to be the Klamath (or, as he spells it, *Kamath*) River, but that flows out of the lower lake proper, and the former is probably Williamson's River. His camp here was about lat. $42^{\circ} 51' 26''$ N. long. $121^{\circ} 20' 42''$. In these errors he has been followed by other writers. Antelopes (*Antilocapra americana*) were plentiful in the vicinity, but the horse-fly rendered our horses almost frantic, sucking their blood, so much so that we

VIEW OF SILVER CITY, NEVADA (1895).

had to enclose them with a circle of smoky fires, and when riding to be continually switching them off, until the poor animals were perfectly bespattered with their blood. These, and mosquitoes (which "crowd" into their ears), are the great pests of horses, though the latter only trouble man, and disappear as settlements and clearings progress. So troublesome are the latter insects on some of the flats of Fraser River, as to render them uninhabitable in summer, and I have known horses in their agony to jump into the river and be drowned.

For the last two days—in fact, immediately after getting over the summit—the

"Manzanita," of Californian celebrity (*Arctostaphylos glauca*), and the "Chinquapin" (*Castanopsis chrysophylla*), began to appear, along with the diminutive *Arbutus tomentosa*. Two Indians were seen on horseback, and waking up at night, I could see the light of a camp-fire gleaming among the trees somewhere on the other side of the marsh.

On the 2nd of August, after travelling ten miles, we came to a straggling creek, with a great extent of rich grasses by its borders, but the soil very poor and sandy. We named this stream—the only one for several miles—"Rifle creek," from the circumstance of our finding a rifle, shot-pouch, and powder-horn complete, suspended in the trees. The pouch contained two flint arrow-heads, used evidently to raise fire, and the rifle had been apparently purchased or stolen, or was the gift of a white man. Underneath was a fire, in which most probably the body and possessions of its former owner had been, in accordance with the customs of the neighbouring tribes, burnt; but how the rifle escaped we could not tell. Having no desire to rob the dead Indian's pyre, we merely kept the arrow-heads as a memento, replacing the rifle; but one of our packers was not so delicate: looking upon it as a fair prize, he tinkered it up, and within an hour shot an elk with it. Scott's Peak was here directly abreast of us, and is a truncated cone of a very marked character.

On the morning of the 3rd of August we were early astir, and after a march of seven miles turned down again to a beautiful prairie near the Klamath Marsh, where the party lay over for several days, and the animals revelled in a paradise of clover. We could see Indians in canoes gathering the pods of the yellow water-lily on the marsh, and tracks of the grizzly bear did not make our woodland botanising any pleasanter. Here I bade good-bye to my gallant *compagnons de voyage*, from whom I had received so many kindnesses, and accompanied by Lieutenant J. McCall, and an escort of six troopers, rode over the ridge to the westward to a fort established in Klamath Basin, and supposed to be distant between fifteen and twenty miles. A pleasant ride had we over a low ridge, and spur of the Cascades, through a fine grove of yellow pine (*P. ponderosa*), where we shot a skulking coyote wolf (*Canis latrans*, Say), and then descended into a valley where Indian sign was plentiful; until from an eminence the lovely prairie of Klamath Basin, shut in by snowy mountains with cold rivers meandering through the valley, and studded with groves of trees, like wooded islands in a sea of grass, burst upon our astonished view, so long accustomed to the arid track over which we had been passing. We crossed the "Fort Creek," a stream of icy-cold water (which springs out of the ground in one torrent), our horses almost hidden amidst the luxuriant herbage, and then passed through a mile or two of country, which might easily have been mistaken for, and reminded us of, some old English park. We arrived at the fort just in time for dinner, but covered with dust, and presenting most unfashionable figures; for here in the middle of the Indian country were several of the Oregon ladies, of whose politeness generally, and more particularly of the "square meal" we received that August evening, I daresay the lieutenant and I have some very grateful memories to this day.

There were also a number of children here, semi-civilised youths, learned in all the dialects of the Chinook jargon, and in the relative merits of Maynard's carbine and the old jager. They were, however, about to erect a school, which promised to impart something more substantial to them. The valley of Klamath Basin is excellent soil, but cold

springs came down from the snow-capped mountains, which shut it in on every side, so as to render the ground so cold that snow lies for such a time that cattle cannot subsist here in the winter, and garden produce, with the exception of beets and turnips, does not come to any size. Down by the borders of Klamath Lake and Sprague's River the snow lies only for a short time, and there the Indians winter their horses. Close by the fort flows an icy cold stream, which rises directly out of the ground not far distant. This Fort Creek joins Wood's River and Crooked Creek, which empty into the Klamath Lake some three or four miles down. During the few days we passed at Fort Klamath, Major Rheinhardt and his officers took us on an excursion down Wood's River, meandering through grassy meadows to the great Klamath Lake, and back again on horseback over the prairies, with a picnic dinner under the groves of pine—an excursion which will live in the memories of some of us. At Fort Klamath we overtook the Hon. W. P. Huntingdon, Superintendent of Indian Affairs for Oregon, who was awaiting a messenger whom he had despatched to Pah-ni-ne, war chief of the Shoshones, with a view to make a treaty of peace. Mr. Huntingdon was good enough to invite me to join him, and as the distance was not great, and such a sight would not be soon likely to be seen again, I occupied myself in rambling round the hills until his messenger returned. Our visit had created some stir among the neighbouring tribes, who were suspicious of the import of it. Accordingly, one day a messenger arrived from a distant tribe to make inquiries what it all meant. He was informed, and invited to stay, Major Rheinhardt at the same time offering him fodder for his horse, and food accommodation for himself. He steadily refused, however, and would receive neither bite nor sup from the whites, bringing provision from the Klamath Indians in the vicinity of the fort, and sleeping in the open air. This cavalier stayed long enough to satisfy himself of our intentions, and then left as he came, refusing presents or any kindness which might seem to compromise him with the whites into surrendering his freedom.

In the immediate vicinity of the fort were a number of Klamath Lake Indians, a people at no time of a very exalted morality, but now thoroughly debased. The northern tribes have a thorough contempt for them, and used to come south and capture them as slaves. It is, however, a common practice of many of these tribes—Shastas, Umpquas, Klamath, Pit River, &c.—to sell their own children as slaves. Mr. Stanley, an artist, who travelled for some years on this coast, tells us that during a tour through the Willamette valley in 1848 he met a party of Klikitaks returning from one of these trading excursions, having about twenty little boys whom they had purchased from the Umpqua tribe. They have, however, a number of slaves, principally stolen from the Pit River Indians, who are again a race much lower in the scale of humanity. A runaway slave is severely punished among them, being generally put to death. If a woman, she is impaled on a stake in a manner too horrible to describe. Their other property consists in beads, horses, blankets, and women. The Hioqua shell (*Dentalium preciosum*, Nntt) is highly valued among them, and is generally worn by the men through the septum of the nose, the women also occasionally adopting this ornament, and more frequently using it in the form of ear-ornaments. The women have a custom of tattooing their chin, and some of them are far from ill-looking. They have now for the most part

adopted a portion of European dress, but all the women still wear the little brimless hat, like a pitcher. This hat is made of a species of sedge, but is quite water tight, and is used for a variety of domestic purposes, such as carrying water or lighted coals, as a drinking vessel, and a trencher for food. They have a belief in a Supreme Being, and think that He made the land good and bad—sage-brush, desert, and pasture land—because the Indians quarrelled and had to be separated. Some of them also believe in a place of reward and punishment, and others even go so far as to believe in a resurrection from the dead, and that the place of resurrection will be at the Dalles of the Columbia. They have a great belief in their "medicine-men," who excel in the usual tricks of that class of impostors, such as causing blood to flow from the nostrils, and so on. They have a superstitious dread of owls, believing, like all Indians, that the spirits of the dead go into these birds, and that they peek out people's eyes. They bury their dead in mounds in an upright position, but destroy by fire the whole of their property, because it is very unlucky to mention the name of the dead; they do not wish to see anything around which would act as a reminder to them of those who are now dead. I have sometimes heard it stated that they burn their dead, but as I saw their graves, I cannot believe that this custom is at least unvariable. After a death, and in the case of women at certain periods, they must purify for five days at a sacred spring near the fort. Eclipses they believe, with many of the people of antiquity and modern times, portend evil. They have many other superstitions about almost every act of their daily life. They are said to have some knowledge of diamonds, which are believed to be found in their country. They are also reported to be tolerably honest about the fort, for the good reason that they would soon be found out, and be most summarily punished. They are not allowed to purchase powder from the trader at the fort, except by order from the Superintendent of Indian Affairs; but they buy all they wish at Yreka, in California, to which place there is a trail from here. They occasionally go to war against the Pit River tribes, and have a curious method of declaring war. A number of young fellows prowl about the border of the enemy, until they see some women gathering berries, or otherwise engaged, when they seize upon them. This indignity is reported to the tribe, when war is the consequence. Throwing in this bone of contention is fully as effectual as the Roman custom of throwing a javelin into the enemy's territory. They marry either in their own tribe, or in the neighbouring ones, and as a natural consequence of the increased immorality of the tribe, infanticide is common. The number of males, owing to this and other causes, is also decreasing. As a race, they are swarthier than the northern tribes, but not badly made. I used often to meet them on my rambles through the valleys and groves near the fort, and they were always particularly civil to me when they heard that I was an Englishman. The English they both fear and respect, because the earliest knowledge they had of the race was by experiencing the severity and determined character of a Hudson's Bay trader named M'Kay—a son of that M'Kay who blew up the *Tonquin*—as narrated in "*Astoria*." Hence the Hudson's Bay Company's people were long known as the "M'Kays." Fremont they distinctly recollect, and tell some long story about his spitting on a fish, the exact point of which I could never exactly learn, further than that it was looked upon with great superstition, and was supposed to have been productive of no great good.

In addition to Indians, many other wild animals used to dart across my path while roaming about in search of flowers.* The coyote wolf (*Canis latrans*) will even now and again skulk through the valley, or yelp when at a safe distance from me. The silver fox (*Fulpes macrourus*), so valuable as a fur, was once seen, and the holes of the badger (*Taxidea americana*) were occasionally stumbled on. The fisher (p. 198) is common by the Klamath Lake, and the beaver may be occasionally seen. The *Hesperomys Gambellii*,

AT WORK IN THE SILVER MINES OF NEVADA.

rather rarer, is sometimes captured with other small mammals, while the sage rabbits (*L. artemesia* and *L. campestris*) scuttled through the low grass and brushwood very commonly. Many wild fowl breed in the lakes, and in this vicinity a naturalist might pass many weeks in the spring with great profit.

The monarch of all these solitudes is, however, the grizzly bear (*Ursus horribilis*),

* For the botany, see Horticultural Department of "Farmer" (1865), and "Pacific Railroad Surveys" (Newberry's Collection), Vol. vi. (Williamson's Report); "Transactions of the Botanical Society of Edinburgh," Vol. ix.

which abounds in the mountains. The winter before, the soldiers, by surrounding him in parties on horseback, managed to kill a large number. He is rarely, however, tackled by a single hunter, as the danger is great. Not a year passes in California but some men are killed by this fierce animal, and further north the Indians are often maimed in encounters with it. The country eastward I afterwards visited. It is still drier, for the fort was built in a moist valley of the mountains, mountain-walled on almost every side. But this other journey again westward into California I need not describe, as the gist, so far as space will admit of, I have given already, or will give in due course. It is the country of the Shoshonee and Modoc Indians, aborigines whose murderous doings have made them very familiar characters of late years.

CHAPTER XVI.

THE UNITED STATES: THE PACIFIC TERRITORIES AND STATES.

AFTER the preceding sketch of the physical geography and general appearance of the region to the west of, and in the vicinity of the Rocky Mountains, we must devote a brief space to a more special description of the political divisions into which this great region is divided. British Columbia has already been spoken of. Accordingly, it is only the states and territories of the United States that demand a few lines at our hand. First, therefore, we must take up

ALASKA,

Or Aliaska, of which the name is an abbreviation. Up to the year 1867 it was known as Russian America, being a possession of the Northern Empire, and used solely as a hunting-ground of the Imperial Fur Company, though governed by State-appointed officials. It is the most northern portion of America, and has a coast line facing the Arctic Sea on the north, and the Pacific on the west. Historically it is insignificant; and from a literary point of view its only eminence is due to the fact that it is the locality selected by Eugène Sue for opening the remarkable travels of his hero, *Le Juif Errant*, a fact which may possibly give it celebrity in the eyes of those to whom geography and treaties are but dry realities. It comprises all North America, from 141° W. long. to the sea, as well as the many islands which stretch seaward along the coast line, in addition to a strip of territory fifty miles broad, extending south-east along the Pacific Coast to the confines of British Columbia in 54° 40' N.L. Altogether, its length is about 1,100 miles, its greatest breadth from east to west 800 miles, and its area about 581,000 square miles. It is for the most part covered with dense forest, and when not rocky and forest-covered consists of swampy plains, and is altogether unsuited for agriculture. The Yukon, or Kwichpak, which rises in British America, and falls into the sea at Norton Sound, is the finest of its rivers. At a distance of 600 miles from the sea it is a mile in breadth, and

some of its tributaries, such as the Porcupine, which it receives at Fort Yukon, would be reckoned large rivers in Europe. Such is the volume of water which it pours into Behring Strait, that ten miles from its principal mouth the surface-water sea is fresh. Among its mountains may be mentioned Mount St. Elias, an active volcano 18,970 feet in height, while in the peninsula of Alaska are several volcanic cones, and in the Island of Oonimuk there are volcanoes so large that one rises to the height of 8,000 feet. The Imperial Fur Company, which in 1799 obtained a grant of the country from the Tsar Paul I., had their chief settlement at New Archangel, on the Island of Sitka, and about forty other trading stations. They exported annually about 25,000 skins of fur seal, sea-otter, beaver, &c., and about 20,000 walrus tusks, obtained from the more Northern tribes. In 1867 the Russian Government sold the whole country to the United States Government for 7,200,000 dollars, not a large sum for so huge a mass of territory, but great when we consider that it can never be of any value to the authorities at Washington, except for a possible political contingency, which, since British Columbia has thrown in its lot with Canada, is not likely ever to occur. It is at present governed by the naval force at Sitka, the crew of the one vessel there acting as a police force in case of emergency; but the trade is of the most infinitesimal description, and the settlers so few, that it has not been thought necessary to organise a territorial government. The climate of the Southern Coast region is comparatively mild, but excessively wet. The mean temperature of Sitka is 42.9°, and its rainfall about six feet per annum. During the winter it rains almost continuously, and the summer and autumn are exceedingly moist seasons. Cereals grow, but do not ripen, though grass, if there were only more open land, would prosper very well as a cultivated crop. Veins of coal have been found, and gold has in some places been discovered in considerable abundance. Salmon abound in all the rivers; and about forty whalers pursue their dangerous trade off the coast of this Russian possession in North America. There are said to be about 3,000 whites in the country, but this is a very shifting population indeed. The Indians far outnumber them, being about 16,000, in addition to as many Eskimo on the northern shores. Sitka contains about 1,500 inhabitants, and is the residence of a Greek bishop and a few storekeepers. The fur trade must, however, always supply the chief trade of the territory, that is to say, if the fur animals are not exterminated through ignorance or indifference on the part of the Government, and rapacity on the side of the settlers. The trapping in the interior is chiefly left to the natives; but the fur seal is killed by the settlers, aided by the Aleutians, in such great numbers, that the animal threatens in time to meet the fate of the *Rhytina*, a species of sea-cow once abundant on the islands of Behring Strait, but now so entirely extinct, that a few of its bones are accounted prizes of great value by any European museum. The privilege of killing fur seals on the Pribylov Islands is let by the Government to a commercial company, under conditions and restrictions of a salutary character. As a specimen of the value of this "fishery," I may note the terms of one of the bids. It offered 50,000 dols. a year rental, with a royalty of 62½ cents on each skin. The number of seals to be killed was limited to 100,000 a year; the royalty would thus amount to 62,500 dols. a year. The contractor offered a further bonus of 55 cents a gallon for all oil taken from these seals. Each seal is estimated to furnish, on an average, ten gallons of oil. This would make 111,000 a year, or a total

of 2,225,000 dols. The contractor, whose bid we quote, also offered to supply the Aleutians on the St. George and St. Paul Islands with free school facilities, fish, oil, firewood, red shirts, and all other necessities that the 300 aborigines required, including the luxury of a priest of the Greek faith. Probably the Government thought that the contractors were offering more than they could pay, for, as a matter of fact, the fishery is at present let for 317,000 dols. *per annum*. The sea fisheries are also important.

The sea-otter hunting is even more valuable. This animal is found all down the Pacific coast, from Alaska to California, and also for some little way on the Asiatic side. It is, perhaps, the most valuable fur animal in America, and therefore I may devote a short space to its description, more especially as in the notes which follow I am indebted for much of the information to my old friend, Mr. Pym Nevins Compton, formerly of the Hudson's Bay Service, and who was, perhaps, as well acquainted with the habits of the sea-otter as any man living. I will, therefore, first quote what he has to say in his own words:—

"The sea-otter (*Enhydra marina*, p. 305) is an animal whose habitat is confined to the waters of the North Pacific, and is found as far north as the Aleutian Islands, or thereabouts, and as far south as the coast of southern California, on the coast of North America, whilst it also occurs on the coasts of Japan and the northern parts of China. Unlike the common otter of North America (*Lutra canadensis*), it is now never found in the numerous inlets with which this western coast is so plentifully indented; but is always seen in the open ocean in the neighbourhood of rocks and rocky islets, such as those around Scott's Islands, at the northern end of Vancouver Island, and appears to prefer those localities where very strong tides cause broken water, in which it loves to disport itself. The young, which are produced generally (as far as I can learn) one or two at a time, and that once a year, are of a rusty-brown hue, with numerous long hairs of a yellowish colour about the head, and when born are not much more than a foot or eighteen inches in length, but appear to grow rapidly; though it is long before they lose the brownish colour which with age changes from the rusty hue of the young to a dark chocolate tint, and from that to the beautiful dark black fur of the adult male. The appearance of the *Enhydra* in the water is (although its habits are very similar) very different from that of the seal, not only in colour (being much darker), but in the shape of the head, that of the seal being very round, whilst that of the sea-otter is of a much more elongated and pointed form. The feet are more like the feet of the beaver than the flippers of the seal family; the hind feet are webbed, but unlike the web of the beaver, that of the sea-otter is covered with hair almost, if not quite, to the extremity. It is needless to add that the sea-otter swims and dives with extreme rapidity, but does not sink immediately on being killed, like the seal. The size of a full-grown male sea-otter is about six feet, though I have frequently seen skins measuring upwards of seven feet without the tail, which is always cut off, and forms a separate item in the trade, and is generally a perquisite of the wife of the fortunate hunter. The females are rather smaller, and seldom entirely lose the brownish tinge on the fur, and, I believe, never acquire the white head of the old males. These animals are rarely seen on shore, though they are capable of walking on land, and are not confined to the awkward though rapid 'flop' (I can find no other word so expressive) of the seals

when on *terra firma*; but at the breeding season they frequent isolated and barren rocky islands, seldom troubled by man. Their food consists in a great part of shell-fish, for the

SEA-OTTERS (*Enhydra marina*).

grinding up of which their massive molar teeth are admirably fitted; and they are stated by the Indians to be very partial, like the common otter, to a small species of *haliotis* (*H. kamtschatkiana*), ear-shell or abalone, as it is called in California, which is plentiful all along the coasts of North-West America. The skin of the sea-otter varies much in price

according to size, colour, fineness of fur, &c., and the best idea one can give of it is a mole about six or seven feet long; but that even gives an inadequate notion of the beauties of this costly fur, for costly it is, as a single good skin will, before being dressed, fetch as much as £30 in England, and considerably more when prepared and sent to China, where they are in great demand. Formerly the sea-otter was killed with the bow and arrow and spears, but since the whites have supplied the Indians with muskets and ammunition, firearms have taken the place of the more primitive weapon; but I do not think that more animals are killed now than formerly, and in fact the Indians themselves say that the noise of the gun frightens the otters (naturally a very wary animal), and that fewer are seen, and these more difficult to approach than in the 'good old times' of the bow and arrow. The otters used to be purchased by the Hudson's Bay Company by the size; a blanket being given for a span of the trader's hand, measuring lengthways of the skin, and the Indians employ even now all sorts of means to make the otters as long as possible (a practice decidedly detrimental in many cases to the fur), such as putting the skin in a frame after they reach home, wetting the hide with warm water, and scraping it with a shell to make it soft and pliable, and even in some cases pricking it all over with a number of needles tied together, and at the same time tightening up the lines at each end by which the skin is attached to the frame, so as to make it reach the required number of 'spans' in length." It may be added that a trader with a long thumb and forefinger was specially in request by the fur companies.

Formerly it was very abundant along the Californian coast, and was one of the attractions that induced the Russian Fur Company to establish Fort Ross in lat. $38^{\circ} 30'$, where for a number of years (from 1812-1840) Aleutians were engaged in the fishery. Mr. Hittel describes these Indians as going out in their cayaks fifty miles to sea, or travelling up and down the coast, usually coming home well laden with skins, then worth from sixty to eighty dollars each. At one time the Hudson's Bay Company tried to employ Sandwich Islanders in the trade. The hunters went up and down the coast in small vessels shooting the otters. Instantly on the animal being struck, the aquatic Kanaks swam off to it, or, if necessary, dived in pairs, and it was rare indeed that they did not succeed in bringing the valuable carcass to the surface. Off the coast of Santa Barbara country they are still plentiful, and there are men in that section of California who make a trade of killing them. It only approaches near the shore once a day for food; and when attacked makes no resistance, but endeavours to escape by sinking in the sea. The skins are chiefly in demand by the wealthy Russians, and are also exported to China, where a market is found for them among the higher mandarins of the Celestial Empire.

WASHINGTON TERRITORY, OREGON, AND IDAHO.

A very few words will suffice to give the salient features of these three political divisions of the United States. The first two are divided into two almost equal portions, differing widely, however, in climatic, agricultural, and commercial character by the Cascade Mountains. The other—Idaho—is altogether to the east of the Cascades, and is to the west of the Rocky Mountains, thus partaking of the arid character of that region (p. 284).

Washington Territory lies south of British Columbia, and is divided from it by the Columbia River, which runs in the British province, and after forming a bar falls into the sea between Capes Adams and Disappointment. The territory is 360 miles in breadth and 220 in length, while of its area of 44,796,160 acres, only 192,016 are improved, very little land being adapted for agriculture. The region to the east of the Cascades, though open, is in general rather mountainous or dry, while that to the west is densely wooded, the price of labour on the Pacific coast rendering the cost of "clearing" the land in most cases out of all proportion to its return. The soil, however, is rich, and when, as in the vicinity of the Puget Sound and the Columbia River, cultivation goes on, the yield of grain to the acre is very high. The eastern region is, however, well adapted for grazing purposes, while in the vicinity of the mouth of the Columbia, and especially of Puget Sound, extensive saw-milling operations go on (p. 258). The Columbia is the only navigable river, and vessels of 300 tons can pass up it to the Dalles or rapids of the river, where there is a little town of the same name. The scenery on the banks is not fine, the sombre woods to the west of the Cascades making the view rather monotonous, while on the other hand the bare wastes to the east of that range weary the eye of the voyager up this noble river. Here and there, however, the traveller has glimpses of the snow-capped peaks of the Cascade range, such as Mount St. Helen's, Mount Adams (9,570 feet), Mount Rainier (14,414 feet, p. 309), Mount Baker, and Mount Olympus, nearer the coast, and from which a cool breeze daily blows. Some of the rivers are interrupted by falls, such as the Snoqualami, which flows into the Puget Sound, and some distance from the sea plunges over a sheer cliff 197 feet in height. This is, however, surpassed by the falls of the Snake River, a tributary of the Columbia in Idaho, which are said to be only inferior to those of the Yosemite and Niagara. The "Shoshone Falls" of the Snake, just below the Malade, are in clear perpendicular height 200 feet, the river being at this place about 230 yards in breadth. Gold is mined here and there in Washington Territory, as in almost every other portion of the United States, but its chief resources are lumber, grazing, hunting, and fishing, all the rivers abounding with salmon, numbers of which are salted, dried, or put up in tins for exportation. The fur animals, once abundant, are now almost exterminated, though deer and other kinds of game are still plentiful, and in the vicinity of Puget Sound and elsewhere give employment to several professional hunters. The Indians, though now mostly removed on "reservations," and as everywhere else on the decrease, are still numerous, but peaceable. The territory, however, has never recovered from the Indian war which in its earlier days desolated it. It is not fitted at present for a large population. Olympia, the capital, is a large village on Puget Sound, and none of the towns are much bigger, while the total population is not over 70,000, and is now increasing rapidly. In 1884 there were a little over 67,000 Indians in the territory.

Oregon is an infinitely more prosperous State. The eastern region is not so well suited either for grazing or agriculture as the eastern region of the territory north of it; but we have already spoken sufficiently regarding it. The country to the west of the Cascades, however, is much superior. It is not so densely wooded, the climate

is not so wet, and there are numerous open valleys and fertile tracks along the river banks which support a flourishing population of farmers. It is on an average about 276 miles broad and 345 long. It contains an area of 60,975,360 acres of land, of which about 3,176,000 are improved, and a population (in 1880) of 174,768 whites, 5,854 Indians, more than 9,400 Chinese, and a number of other nationalities, including negroes and a few Sandwich Islanders. The population is increasing at the rate of about 8,000 a year. The climate is mild and pleasant, though warmer in the summer, and scarcely so wet in the winter as that of British Columbia and the northern parts of Washington Territory; otherwise it is much the same. The mean temperature of Astoria at the mouth of the Columbia is 42.43° Fah., while Corvallis, in the centre of the Willamette Valley, is 31.27°. By way of comparison it may be mentioned that New York in winter has a climate averaging one degree below the freezing point, while Albany, the capital of the State, suffers a mean winter cold of 25.83°. Few of the products of temperate North America but will grow in the State, while cattle, sheep, pigs, and all other kinds of stock are abundant. In Rogue River Valley nothing is more common than to see the porches of the pleasant-looking farm-houses covered with bunches of ripe grapes, while water-melons, Indian corn, and tomatoes are the most common kind of crops in this pleasant region of the world. The scenery is pleasing, and even in places grand, consisting, especially in the southern portion of the State, of rich, beautiful valleys, fine mountains, forests, and rivers, while the lake country described in the last chapter, and soon to be the site of a big manufactory and a young population, is very magnificent. The Willamette Valley alone is capable of producing 100,000,000 bushels of wheat annually. Already it "raises" 6,000,000 bushels, but it is not all under cultivation. The Umpqua, Rogue River, Umatilla, Nehalem, and Grande Ronde Valleys are other localities supporting a considerable farming population, and destined to support still more. The Willamette is, however, the chief locality for settlement, and in this region are the principal towns, Portland, Oregon City, Salem, &c., the last named, though by no means the largest, being the capital. Fruit is also extensively grown, while wool mills are becoming plentiful, and are run entirely upon the State-grown wool. The fisheries will always be important if properly nursed. In addition to incredible numbers of salmon, the sale of which is estimated at 2,000,000 dollars annually, the sucker fish (*Catostomus commersoni*?) is got in great numbers in Lost River, twenty-five miles beyond Link River, in the months of April and May. This river, according to Mr. Small,* from whom we derive our information, is deep and sluggish, and yet these fish are so numerous that they can be thrown on the bank with the greatest ease. Settlers have been known to take out in this way as much as a ton weight of them in an hour. Cod, bass, flounder, carp, sturgeon, and smelt are caught in great abundance in the Columbia River and in the bays off the coast, while shell-fish are equally plentiful. The gold mines of Eastern Oregon yield plentifully. In Grant County alone 10,000,000 dollars worth were taken out in the seven

* "Oregon and her Resources" (1872). See also, for very trustworthy information, Murphy: "Rambles in North West America" (1879); Nash: "Two Years in Oregon" (1882); the article on the State, by Mr. Hawes, in Ripley and Dana's "American Encyclopædia" (1875); and Mosley: "Oregon" (1878).

VIEW OF MOUNT RAINIER, WASHINGTON TERRITORY (FROM THE NISQUALLY PLAINS).

years prior to 1872, while Jackson and Josephine to the west of the range have done very well. In the former county, from 1852 to 1868, about 15,000,000 dollars' worth were obtained. In the sands at Coos Bay is scattered a considerable quantity of fine gold, and as the tide retires it is washed and amalgamated with quicksilver; the quicksilver thus catching the fine gold, and being afterwards driven off by heat, leaves the precious metal behind. The same method is pursued at Crescent City in North California and at other places. Silver is also mined, while lead, copper, and iron promise in time to be profitable mining industries. Railways now intersect the State, where a few years ago were only Indian trails. Even the "Central Oregon," which Thackeray in his satire on the Railway Mania of 1845 classed with "Patagonian Consolidated" as one of the absurdities of the Stock Exchange, is now a reality. It runs, with some breaks, from California to Puget Sound. Altogether, there are 900 miles of iron road.

Of *Idaho* little need be said. It is the territory west of Wyoming and Montana, north of Utah and Nevada, and east of Oregon and Washington Territory. It is, from its extreme northern to its extreme southern points, 485 miles long, and varies in breadth from nearly 300 miles at the south to 50 at the north. Its area is 55,228,160 acres, of which 200,000 are cultivated. The population was, in 1880, exclusive of tribal Indians, 32,610, of which 3,379 were Chinese, and 418 "tame" Indian or "coloured." Of this number less than half were females. The territory is intersected by spurs of the Cascades or the Rocky Mountains, under the names of the Bitter Root Range, the Salmon Mountains, and the Blue Ridge. The southern country is more elevated than the north; but agriculture, owing to the dryness of the country, cannot, even with the aid of irrigation, ever be a great industry. Gold and silver mining is the chief occupation of the rather roving population. Gold to the value of 1,500,000 dollars, and silver to the amount of 2,000,000 dollars, were mined in 1882. The winter climate is cold and stormy, and frequently rainy, but the summers are dry and hot. The Lewis or Snake River, the Salmon River, the Clearwater, and a portion of Clarke's River, traverse respectively the east and south parts of the State. In the centre and northern parts, Idaho City, Malade City, Silver City, Lewiston, and Boise City (the capital, which had in 1880 less than 1,900 inhabitants), are the chief towns, and the population, looked at in its entirety, is about the roughest on the Pacific slope of the Rocky Mountains. It used to be told as a veritable tale that one Sunday morning, in the first-named town, a citizen was disturbed by shouts and yells down the street. He rushed out, but returned intensely disgusted and disappointed. 'Why! *only* a man shot; I thought it wor a dorg fight!' was the soliloquy of the murder-ennuyed Idahoan. Though it is very tempting to generalise on this anecdote regarding the manners and customs of the population of this territory, I should be exceedingly sorry to present it as anything more than a materialised impression of a portion of the ideas that obtained possession of gold miners during the "rough times" of 1862, 1863, or 1864.

CALIFORNIA.

The "Golden State" is not only the greatest of all the United States Pacific possessions, but it is the most typical of them all. Oregon, no doubt, was partially settled by Americans before California was, but all the other territories and states, including even British Columbia and Vancouver Island, received a contingent from California, while they one and all took their ways of life, and their impetus from, what was, prior to 1848, a province of Mexico, and, with the exception of a few Europeans here and there on the coast, or living in the interior, peopled by Hispano-Americans. I believe that it would be impossible to better economise the brief space at our disposal than to simply quote the remarks with which Mr. Hittell prefaces his classical work on California.* In a few words they present a condensed view of the remarkable features of the State. "I undertake," writes this graphic and most trustworthy historian, "to write the resources of a State which, though young in years, small in population, and remote from the chief centres of civilisation, is yet known to the furthest corners of the earth, and, during the last twenty-six years, has had an influence upon the course of human life, and the prosperity and trade of nations, more powerful than that exercised during the same period by kingdoms whose subjects are numbered by millions, whose history dates back through millions of years, and whose present stock of wealth began to accumulate before our continent was discovered or our language was formed. I write of a land of wonders; I write of California, which has astonished the world by the great migration that suddenly built up the first Caucasian community on the shores of the North Pacific; by her vast yield of gold, amounting, within thirty-five years, to 1,155,000,000 dols., which has sensibly affected the markets of labour and money in all the leading nations of Christendom; by the rapid development and great extent of her commerce; by the greatness of her chief port, which at one time had more ships at her anchorage than were ever seen together in the harbours of either Liverpool, New York, or London; by the swift settlement of her remote districts; by the prompt organisation of her government; by the liberality with which the mines were thrown open and made free to all comers; by the rush of adventurers of every colour and tongue; by the prices of her labour and the rates of her interest for money—double those of the other American States, and quadruple those of Europe; by the vast extent of her gold-fields, and the facility with which they could be worked; by the auriferous rivers, in which fortunes could be made in a week; by antediluvian streams richer than those of the present era; by beds of lava, which, after filling up the beds of antediluvian rivers, were left by the washing away of the banks and adjacent plains to stand as mountains, marking the position of a great treasure beneath; by nuggets, each worth a fortune; by the peculiar nature of the

* "The Resources of California" (4th Ed.). The literature of the State is voluminous. However, in this treatise, and in that of Cronise ("The Natural Wealth of California") and Fisher ("The Californians"), as well as in the publications of the "Californian Geological Survey," especially the contributions of the Director—Professor Whitney—the reader will obtain ample and all but exhaustive information. The guide-books so profusely distributed by railway and land companies must be received with caution.

mining industry; by new and strange inventions; by the washing down of mountains; by filling the rivers of the Sacramento basin with thick mud throughout the year; by lifting a hundred mountains from their beds; by thousands of miles of mining ditches; by aqueducts, less durable, but scarcely less wonderful, than those of ancient Rome; by silver mines that promise to rival those of Peru; by quicksilver mines surpassing

MONTGOMERY STREET, SAN FRANCISCO.

those of Spain; by great deposits of sulphur and asphaltum; by lakes of borax; by mud volcanoes, geysers, and natural bridges; by a valley of romantic and sublime beauty, shut in by walls nearly perpendicular, and more than three-quarters of a mile high, with half a dozen great cascades, in one of which the water at two leaps falls more than a third of a mile [the Yosemite Valley]; by a climate the most conducive to health, and the most favourable to mental and physical exertion—so temperate on the middle coast that ice is never seen, and thin summer clothing never worn, and that January differs in average temperature only eight degrees of Fahrenheit from July; by

THE CAPITOL, SACRAMENTO

a singular botany, including the most splendid known group of coniferous trees, of which half a dozen species grow to be more than 250 feet high, and one species that reached a height of 352 feet and a diameter of 30 feet in the trunk; by a peculiar zoology, composed almost of animals found only on the coast, and including the largest bird north of the Equator [the Californian vulture], the largest and most formidable quadruped of the continent [the grizzly bear]; by the importation in early years of all articles of food, and then by the speedy development of agriculture, until her wheat and wine have gone to the farthest cities in search of buyers, and until her markets are unrivalled in the variety and magnificence of home-grown fruits; by the largest crop of grain and the largest specimens of fruits and vegetables on record; by a society where for years there was not one woman to a score of men, and where all the men were in the bloom of manhood; by the first large migration of Eastern Asiatics from their own continent; by the first settlement of Chinamen among white men; by the entire lack of mendicants [?], paupers [?], and almshouses; by the rapid fluctuations of trade; by the accumulation of wealth in the hands of men, most of whom came to the country poor; by the practice—universal in early years—of going armed; by the multitude of deadly affrays and extra-constitutional courts [vigilance committees], which functionaries punished villains with immediate execution, and sometimes proceeded with a gravity and slow moderation that might become the most august tribunals. I write of California while she is still youthful and full of marvels; while her population is still unsettled; while her business is still fluctuating, her wages high, her gold abundant, and her birth still fresh in the memory of men and women who are yet youthful: and I write of her while she still offers a wide field for the adventurous, the enterprising, and the young, who have life before them, and wish to commence it where they may have the freest career, in full sight of the greatest reward of success, and with the fewer chances of failure."

These words are almost a synopsis of the history and resources of the State, and I need only supplement them with a few particulars regarding some of the more interesting, though, indeed, to any one of the points many chapters could be pleasantly devoted. The name California—"Las Californias"—was originally applied by the Spaniards to the country north of Mexico for a rather indefinite extent, but is now confined simply to the American State of that name annexed to the Great Republic in 1848, though not formally admitted as a State until 1850. "Baja," or Lower "California," is the peninsula from Cape St. Lucas to the boundary between the United States and Mexico, and is a part of Mexico. Its breadth varies, and its area is believed to be not more than about 61,000 square miles. The northern and southern extremities of this peninsula, according to Mr. Gabb, consist chiefly of granite rocks and high ranges. Between the spurs of these mountains are numerous small valleys, many of them well watered and fertile. Here, also, are situated the principal mines of the peninsula, which are still worked with success, and in 1867 were producing silver to the extent of 20,000 dollars per month. The middle section is made up of a mountain range called the Sierra Gigantea, or del Gigante, the peaks of which attain an elevation of from 3,000 to 4,000 feet. The settlements are confined to the eastern part of this range, while along the coast are numerous small valleys, with good harbours close by. These spots are fertile, and well adapted for the growth of tropical products. Most, however, of the peninsula is, owing to the extreme dryness of the climate, barren and forbidding in the extreme.

The population has never exceeded from 8,000 to 31,000, chiefly on the southern coast. The fishery of the Californian "grey whale" (*Rhachianectes glaucus*) at one time occupied a number of vessels, mainly in Sebastian Viscaíno Bay, and the pearl-fishery is still pursued actively, the divers being chiefly Yakuí Indians; within the last century and a half it has been estimated that from five to six million dollars' worth of pearls have been obtained from the Gulf of California and neighbouring sea. So much for Lower California, a consideration of which ought properly to come under Mexico. But it is more convenient to speak of it here, though not in political relationship with the United States.

The State of California, or what the Spaniards used to partly know as "Alta California," extends from the Mexican frontier to lat. 42°, while on the east the parallel of 120° is its limit. Its area is estimated at something between 155,000 and 160,000 square miles (Whitney),—though as many as 188,981 square miles are given in some official publications.* Its climate is very different from that of the Atlantic Coast and the Mississippi States. It is divided into a wet and dry season, while that of Lower California is decidedly tropical in its character. Professor Whitney divides the State as to its physical character into three different portions, the central being by far the most populated, and in every respect the most valuable. It comprises the great central valley, drained by the Sacramento River flowing from the north and the San Joaquin from the south. Its length is 450 miles, and its level area about 18,000 square miles. A striking feature of the Sacramento River is the fact that for 200 miles north from the mouth of the Feather River it does not receive a single tributary of any note, though walled in by high mountain ranges. Indeed, the whole of the Great Valley is thus surrounded, the only break being at San Francisco, where the channel which connects it with the sea, viz., the Golden Gate, is only one mile broad at its narrowest portion. In this area are several large mountain lakes, some of which are of pure and fresh water, while others are alkaline and without any outlet. The first of these is Lake Tahoe, which is 1,500 feet deep, and its overflow—the Truckee River—falls into Pyramid Lake, where it sinks or disappears by evaporation. Clear Lake is another sheet of the same nature, while Owen's Lake is the "sink" of Owen's River, and is about eighteen miles in length. Mono Lake is the "sink" of the streams, rising in the Sierra Nevada between Mount Dana and Castle Peak, while Death Valley is the "sink" of the Amargosa River. It has evidently been once an extensive lake, but is now a mud flat in winter and a dusky alkaline plain in summer. At the southern end of the Sacramento division of the Great Valley there is situated the Tulare Lake, which is not over forty feet in depth, but it has an area of 700 square miles, and is surrounded by the "tules" or reeds (*Scirpus lacustris*) which gave it its name. In the Sierra Nevada of California are several high peaks, the highest, Mount Whitney (14,886 feet), being 600 feet greater than any elevation in the Rocky Mountains, and therefore the highest point in the United States. The second region comprises seven counties north of the parallel of 40°. It is thinly populated,

* Walker's "Statistical Atlas of the United States" and "Report of the Commissioner of the United States Land Office for 1866." See also Degroot, in *Encyclopedia Americana* (1883).

and much of it consists only of barren volcanic plains, lying between precipitous "though not lofty ranges." That portion of California lying south and east of the southern inosulation of the Coast ranges and the Sierra comprises an area of fully 50,000 square miles. It is also thinly inhabited, except along the coast, and comprises among other portions the San Diego and San Bernardino counties, which have no drainage towards the sea. It is the Great Basin of California. The fertile portion of it is Los Angeles county, which comprises some of the best lands in the State.

Towards the south-eastern border of the State is a district 70 miles wide by 140 miles long, which belongs to the Colorado River, and is known for its bareness as the

NOB HILL, SAN FRANCISCO.

Colorado Basin. The soil is chiefly sand, here and there packed into low hills, which are continually shifting.

The climate, as might be supposed from the foregoing description, is varied according to the region. If it can be compared with any portion of the world probably Western Europe would supply the nearest likeness to it. The winters are warmer and the summers—especially at night—cooler than in the Eastern States of America. The rain is chiefly confined to the winter and spring months, the atmosphere is drier than that of the Atlantic slope, cloudy days are few, thunder, lightning, hail, snow, ice, and the aurora rarer, the winds more regular, viz., blowing from the north for fair weather, from the south for storms, while earthquakes, though rarely of a severe character, are rather frequent. There is, as Mr. Hittel properly remarks, one climate for the west slope of the Coast range between Point Concepcion and Cape Mendocino; another for the low land of the Sacramento Basin; another for the Sierra Nevada and Klamath Basin; another for the coast south of Point Concepcion; another for the Colorado Desert, and possibly even

CHINESE QUARTER IN SAN FRANCISCO.

more. We will not attempt to tire the reader by a description of all of these climatic differences. Most of them are very pleasant on the whole, and altogether the climate of California is an immense improvement on that of the Eastern States of America and most parts of Northern Europe. The coldest winter days are at noon as warm as the warmest in Philadelphia, while the summer weather in Lower California is hot even to excess. San Francisco has about the worst climate—speaking comparatively, not positively, of the atmosphere—of all California. There the common custom is to wear woollen clothing of the same thickness all the year round. In the interior of the State the climate is much warmer, and thin linen coats are assumed as soon as the summer arrives. One of the inhabitants of that part of the State expresses himself after this fashion, and his plaint gives a very fair idea of the Coast climate at the chief city of the State in July:—"You go out in the morning shivering, notwithstanding the fact that you are dressed in heavy woollen clothing and underclothing, and have a thick overcoat buttoned up to your throat. At 8.30, you unbutton two of the upper buttons; at 9, you unbutton the coat all the way down; at 9.30, you take it off; at 10, you take off your woollen coat and put on a summer coat; at 11, you take off all your woollen and put on light summer clothing; at 4, it begins to grow cool, and you put on your woollen again; and by 7 o'clock your overcoat is buttoned to the chin, and you shiver until bedtime." The mean of the year at San Francisco is 56° , of the summer 60° , and of the winter 51° . At Washington, on the other hand, the means are $56\cdot07$, $76\cdot3$, and $36\cdot05$. The variability of the rainfall is a great drawback to agriculture, and the "drying-up" of the summer has supplied a slang phrase to the Californian vocabulary, so familiar is it. The dust of summer is also a great drawback to the otherwise delightful climate, but the old residents are quite accustomed to it, though the new arrivals consider the gritty clouds which daily roll along the streets quite unbearable.

The scenery of California is very fine at a distance. Near at hand it is disappointing, by reason of the parched appearance of everything. It is only in early spring that the country assumes that blooming appearance which has been so raved about by passing tourists. Old residents, though not unwilling to hear their favourite State lauded—and never were people so in love with a fair land as the Californians are with their huge State, a single county in which is as big as some of the Eastern States—are rather silent when the ever-rich flowery meadows are talked of, as they remember the dried-up brown summer country they had just left.

The sights of California are many, but have already been done to death by the book-inditing tourist, whom the Pacific railroad has given facilities for descending easily on California. Of course, the Yosemite Valley is the chief of these sights. It is mainly remarkable owing to the walls of the valley being extremely high and almost vertical, and to the small amount of *débris* at the base of the cliffs that hem in the valley, which is also noteworthy for its comparative narrowness. "The water-falls," wrote Professor Whitney, who has published the best and fullest description of them, "in and about this valley are also of wonderful beauty and variety. Those of the Yosemite Creek, which descend from the cliffs on the north side, are most remarkable for their height, which is, on the whole, not less than 2,600 feet, but divides into three parts, with one

vertical fall of 1,500 feet. The Nevada and Merced Falls of the Merced River, which flows through the whole length of the valley, combine great height with a large body of water, and are wonderfully grand. The Half-Dome is one of the most striking features of the Yosemite, its elevation being 4,737 feet above the bottom of the valley, with an absolutely vertical face of 1,500 feet at the summit turned towards the Tenaya fork of the Merced, above which it rises. The scenery of the cañon of Tuolumne River, which flows parallel with the Merced, a few miles further north, is also extremely picturesque and remarkable, especially for the great number of varieties of the cascades which occur at short intervals in the deep gorge, the walls of which are bare, and almost vertical precipices, in places more than 1,000 feet high. The river, which is not much less than 100 feet wide, falls 4,650 in a distance of seventy-seven miles. A few miles further down, the narrow gorge opens out into a beautiful valley, in many respects a wonderful counterpart of the Yosemite, though inferior to it in grandeur. This is called the Hetch-Hetchy. Above the Yosemite Valley the scenery of the High Sierra is very attractive, immense conical knobs or domes of granite being a prominent and very characteristic feature of this and other portions of the Sierra. Mount Dana, a little over 13,000 feet in height, dominates over the region above the Yosemite, and from its summit, which is quite easy of access, a magnificent panorama may be had of the Sierra Nevada, with Mono Lake, nearly 7,000 feet below, spread out like a map, and beyond it the lofty, and, in some instances, snow-clad ranges of the Great Basin, while several well-formed and very large volcanic cones are seen just to the south of the lake." The "Big Trees" are another of the familiar wonders of California. The tree is the *Sequoia*, or as it was long called by botanists, the *Wellingtonia gigantea*, one of the fir and pine order. It is found in company with the sugar pine, the Douglas fir, and the pitch pine (*Pinus ponderosa*), but is much more limited in its distribution than any of these widely-spread trees. It is found only in California, and in groves or patches, from lat. 36° to $38^{\circ} 15'$, never at a higher elevation than 7,000 feet, and never much lower than 4,000. There are eight or nine patches of these trees in the State, the largest being that which stretches along the tributaries of King's and Kaweah Rivers, about thirty miles N.N.E. of Visalia. The trees, unlike, however, those in the Mammoth Grove, Calaveras County, are not in a clump, but scattered among other species. The highest yet seen is 352 feet in height, and the circumference of some of them near the ground is nearly 100 feet, or more than thirty feet in diameter. The trunk of many of them six feet above the ground is fifty feet in circumference. One cut down in the Calaveras Grove—the cutting down is now prohibited by a State law—measured six feet above the ground, without the bark, twenty-four feet one and a half inches, and, judging from the rings, was 1,300 years old—or, in other words, it was a very tiny bush at the time that the Roman Empire was beginning to fall to pieces. These trees being now a common sight for all visitors to make a pilgrimage to, they have received—at least, in the Mariposa Grove—all manner of fanciful names, chiefly in honour of passing heroes, which frequently in their turn absurdly give place to other favourites of the hour. The stump of one of them which was cut down has now a house built over it, and is used as a ball-room. We have figured one of these trees at page 277. It is known as the "Mother of the Forest," there being also a father. It is

305 feet in height, and 63 in circumference. The bark has been stripped off for 121 feet. The wood of the big tree is of little value, even were it available, but its close ally, the redwood (*Sequoia sempervirens*), is extensively used for lumber. This species is found in forests on a narrow belt, 300 miles in length, along the coast, in silurian soil, but it does not cross the Oregon boundary, nor go south of the Bay of Monterey.* It is possible that most of the trees of this species are little, if any, smaller than some of those of the *Sequoia gigantea*. I have seen one not far from Crescent City, which had been hollowed out by fire as it lay on the ground, leaving only the bark and a thin shell. A laden mule-train is said to have passed through, nor need the fact be doubted. I have myself seen an elk, or wapiti, hard pressed, take refuge in the angle formed by two fallen trees of this species, and yet fail to leap over them when the hunters approached it, the height being too great for it. The geysers, the hot springs, and a score of other remarkable though not exclusive features of California, might also be cited among its wonders. It is necessary, however, for us now to devote some space to the Californian mines, and, what is even more interesting, the miners themselves.

* For some curious speculations regarding these trees, and botanical history of California generally, see Professor Asa Gray, in "Annals of Natural History," vol. xi., 4th series, p. 62 (1873).

(From Original Photographs.)

THE COUNTRIES OF THE WORLD.

CHAPTER I.

IN the first Volume of this Work we have endeavoured to convey to the reader an idea of the scenery, and the aspects of the plant and animal life of the countries which lie on the Pacific Slope of the Rocky Mountains. Before commencing in our Second to describe the States and Territories of the Great Republic, which lie in and around the Rocky Mountain range itself, it may be well to speak somewhat more systematically of one or two of the industrial features, and especially of the men following the chief occupation of that region. Much of what I shall tell the reader may be already familiar to him from other sources. If such be the case, the writer will be sufficiently pleased, for he will have the gratification of knowing that the impressions he obtained from personal observation are so far accurate that they have struck others beside himself. Moreover, as some of what follows are picture-memoranda of a life that can never more return to the "Wild Lone Land," he is the more anxious to describe it before it is looked upon as mere romance.

THE UNITED STATES: THE INDUSTRIES AND THE MEN OF THE PACIFIC SLOPE.

Taking then California as the best type of the Western Rocky Mountain slope, its resources seem almost endless. At one time gold was the only thing the State yielded; this, though useful as a stimulant to other industries, was not, however, in itself riches. Every ounce taken out of a country makes it so much the poorer, without really making the world either richer or better. But the wealth of California remained to a great extent within its bounds. The swarms of gold-diggers who rushed to it from all the world in many cases remained to cultivate the soil, to erect manufactories and towns, to plant vineyards, hew down the forests, export the timber, build ships, run steamers on the rivers and lakes, and in a hundred other ways aid in the development of the country's resources. Hence gold-mining, though still a prominent occupation of the Californians, is a resource which, even if it failed to-morrow, would scarcely injure the country; indeed, it would rather help it, for it would release a large number of men for other pursuits, and especially to engage in agriculture, for which the country is so admirably suited. We need not repeat the already well-worn tales of the enormous wheat yield of California, of the mile after mile under grain, of the cutting it by machinery, threshing

on the field by machinery, and sacking by the same means all in one day. Neither is it necessary to tell of the enormous fruit yield, of the peaches, the pears, the apples, and the strawberries all the year round, or of the grapes, oranges, and other semi-tropical fruits of the South. Suffice it to say that in California are every manufacture and every industry which flourish in the rest of America, in addition to some which are more peculiarly its own.

Mining.

It was, however, gold-digging which gave this State—and indeed the whole coast—its original impetus, and gold-digging and gold winning will always be associated in the popular mind with this land of gallant men. Gold is mined in various ways. It originally all came from quartz veins, but by the crumbling down of the matrix it is now scattered through the earth, and more particularly in the sand and gravel of rivers which have washed it far away from its original home. It was in such localities that the gold was first washed, and to some extent it is still mined there. The varied apparatus for separating it from the *débris* it is mixed with is all constructed on the same principle, viz., by aid of water to wash the gold scales to the bottom, these being heavier, and leave the sand, earth, and stones at the top to be thrown away. If the gold be very “fine,” *i.e.*, in very minute scales, it is caught by means of quicksilver mixed with the mass in process of washing (Vol. I., page 310). The implements in use, or which have been invented, are simply endless. A comparatively recent mode of washing the gold is, however, so interesting, that we may describe it, and have illustrated it by a figure (Vol. I., Plate X.). This is the hydraulic method. Its principle consists in letting water down from a considerable height, and throwing it under the pressure of its own weight against the “pay dirt,” which is thus torn down, dissolved, and carried into the sluice below. This is effected by means of a strong hose, and is used not to wash the dirt, but to save digging with shovels, and to carry it to the sluice. “The hydraulic process is applied,” writes Mr. Hittel, who has given us the best account of it, “only to claims when the dirt is deep, and when the water is abundant. If the dirt were shallow in the claim and its vicinity, the necessary head of water could not be obtained. Hydraulic claims are usually in hills. The water is led along on the hill at a height varying from fifty to two hundred feet above the bed rock to the claim at the end or the side of the hill, when the water, playing against the dirt, soon cuts a large hole, with perpendicular, or, at least, steep banks. At the top of the bank is a little reservoir, containing perhaps in it more than 200 gallons, into which the water runs constantly, and from which the hose extends down to the bottom of the claim. The hose is of heavy duck, sometimes double, sewn by machine. This hose when full is from five to ten inches in diameter, and will bear a perpendicular column of water fifty feet high; but a greater height will burst it. Now, as the force of the stream increases with the height of the water, it is a matter of great importance to have the hose as strong as possible; so for this purpose in some claims it is surrounded by iron bands, which are about two inches wide, and are connected with four ropes, which run perpendicularly down. The rings are about three inches apart. The ‘crinoline’ hose thus made is very flexible, and will support a column of water 150 or 200 feet in height. The pipe at the end of the hose is like the pipe of a fire-engine hose, though usually

longer. Sometimes the pipe will be eight inches in diameter when it connects with the hose, and not more than two inches at the mouth, and the force with which the stream rushes from it is so great that it will kill a man instantaneously, and tear down a hill more rapidly than could a hundred men with shovels." This stream is directed against the bank with such force that soon the cliff is undermined, and the large mass of dirt tumbles down. (See page 5, which shows another phase of hydraulic mining, viz., when a number of streams of water are directed against the hard "cement" or conglomerated gravel.) This the shovel-men wash away into the sluice or timber-lined ditch, when they commence at the bottom of the bank again, and so on. The gold in the "dirt" is caught in riffles, or cross-bars, placed here and there in the sluice, or impeded in other ways; and then at leisure—generally one a week—cleaned up by the company to which it belongs. The mud from such a hydraulic claim forms long, dreary, grassless flats, very characteristic of such localities, and the quantity washed into the Californian rivers by the operations of the gold miners is now getting so plentiful that these streams are no longer clear as once they were, but roll along milky in hue, and in some cases are absolutely getting shoaled up. Quartz mining is also an important industry on the Pacific. In this case the rock containing the gold is directly mined and crushed in mills or by means of the "arastra," a piece of rock which is drawn by means of mules or horses round in a trough over the broken pieces of quartz, and thus, as in the cases of the mill, though more slowly and cheap, grinding it up into powder. This is aided by the addition of water, while the gold is caught by means of mercury added from time to time to the creamy liquid. This "amalgam" is then heated in retorts, the quicksilver driven off in fumes, and condensed again in water, while the spongy mass of gold remains behind.

Cinnabar, or the ore of mercury, is also extensively mined in California, chiefly at New Almaden, a little west of San José. At one time the mines yielded from 2,500,000 to 3,500,000 lbs. of quicksilver in a year; but the production has now fallen to about 1,280,000 lbs. per annum. Copper is found, and at present several mines are at work. Zinc, tin, lead, and iron exist to some extent. The coal is of Tertiary and Cretaceous age, and poor, though it is mined to the extent of about 37,000 tons per annum. Borax was produced in 1880 to the value of 107,333 dollars; but silver mining, though extensively followed in the neighbouring region—more particularly in Nevada State—has never been very successful in California, except at Cerro Gordo, where the ore is chiefly galena. These mines yielded in 1875 about a million dollars of metal, six-tenths of which were silver. They now yield little. In 1880 the worth of the silver mined in California was 1,150,887 dollars, in Nevada 12,430,667 dollars, while in California 17,150,941 dollars, and in Nevada 4,888,242 dollars' worth of gold were mined. In 1876 the total value of the gold and silver obtained in California, Nevada, Utah, Colorado, and the other states and territories of the United States, was about 75,000,000 dollars.

SOCIAL LIFE.

Perhaps no country has ever had its social life so frequently described as California. To this region came the choice spirits of every nation, and also the reckless desperadoes of the world. All nations amalgamated together, and founded here almost a new race. The wild

excitement of the gold winning, which for years exercised supreme control over the manners and thoughts of the people, has also had its influence in forming society in these regions. The result is a people in many respects unique, though rapidly getting moulded down to that uniform level to which civilisation, railways, telegraphs, and newspapers tone all mankind. A new element has comparatively recently been added in the Chinese; and independently of all questions connected with their effect on the labour of the country, there cannot be a doubt but that in time these Mongol hordes will exercise a wonderful influence on the life of the Western United States. The Indians are rapidly getting exterminated, but the Chinese are not. On the contrary, despite recent restrictive legislation, they flourish to an extent strange to them in their native land. The whole population of the State was, in 1880, 865,000, an increase of thirty-three per cent. since the census of 1870; but as San Francisco had in the latter year only 119,473 people, and has now, it is claimed, a population of little less than 240,000, we may judge from this fact that the State is much more populous than it was four years ago. However, it must be remembered that fully one-half of the people live within an area of 4,000 square miles adjacent to San Francisco. The capital (Sacramento) had in 1880 21,420 people; but no other town had anything like so numerous a show of citizens. The wandering character of the population has a prejudicial effect on its morality, while the greed of gold, and the all-potent result it had in the development of the country, have exercised an evil effect on commercial morality. The scarcity of women, and the want of home-life over a great portion of the country, is a vicious element in Californian life, and indeed exercises a mischievous influence on social existence all over the Pacific slope. There are generally few respectable women living in the mines; with a result that can be easily imagined. The first ornament of the female mind is too often absent in California, and the same love of gain which is developed in the men shows itself in the women, though in an infinitely more fatal manner. I state this on the authority of the greatest historian of the State, otherwise I should hesitate at so sweeping a conclusion from merely a few passing visits. Divorees are very common, and unions unrecognised by the law scarcely less so. The recklessness of life which ever characterised the State still exists to some extent, though in San Francisco and other large cities quiet people can live as securely, and indeed enjoy as polished society, as in almost any other town in America. Extravagance of living is common; but, on the other hand, no man is compelled to live in a style beyond his means merely to "keep up his position in society." Never was there a people among whom the stranger could feel more at home—never a more "sociable" race. In general society there is no asking as to what family the new arrival belongs, whether even he is wealthy. The main facts desired to be ascertained about him before he is welcomed are whether he is well educated, pleasant, and entertaining. There is a liberal tone in all classes of society, and an almost cosmopolitan sympathy with any eccentricity in thought, in manners, or in religion. The people love to be amused, and will pay for it. Accordingly, California is the El Dorado of all actors, singers, and showmen generally, and indeed of every one who has anything to dispose of. Society has been turned upside down here; the rich people have once been poor; some once wealthy are now poor; hence the tolerance, the freedom, and the slight *souçon* of roughness which prevail everywhere,

MINING "CEMENT" BY THE HYDRAULIC PROCESS.

even among people whose surroundings would lead us, in other countries, to expect something else. But if we described Californian life fully a volume would be too small,

and the result such as would please no one. The gold-digger is probably as little altered as any one. Indeed, he is only now settled down into a marked feature in social life. Formerly anybody and everybody were gold-diggers, but now mining is a profession; a trade or a labour we cannot call it, for to mine for gold is never degrading to any man, who might think he was lowering himself were he to drive a team or plough a field. In this respect, it must be confessed, Californian society has a little changed. Still, though you can find men of all classes working at mechanical toil, it is now rare to find men highly educated and well behaved, finding any necessity for so doing. They have either left the State in despair, or gravitated into their proper position. I met, however, in British Columbia, in early times, a good deal of this. But the senior wrangler who found his accomplishments as an oarsman the means of earning his living as a boatman in San Francisco Bay seems to have departed from that locality; though, indeed, pages could be easily filled with similar tales, not more apocryphal, and some indeed which I could vouch for. Let us, however, as our space is limited, say a little about the gold-digger and his ways; and the sketch equally applies to the miner all over the gold regions of North America.

"THE HONEST MINER."

One autumn a few years ago I struck into the wild mountain region of Southern Oregon, just north of the Californian boundary line. I had not gone far on the trail before I overtook a stalwart, grey-shirted, knee-booted individual. He had a pair of scarlet blankets strapped on his back, and as he trudged along, for want of better company, he held an animated conversation with himself, an oath being every now and then very innocently, no doubt, introduced when the merits of the ease seemed to demand it. He was an old gold-digger returning to his favourite "creek." He had been on one of the usual digger wild-goose chases after some fancied El Dorado at a distance, but was returning disappointed to the place where he had mined for many a year. Every locality was familiar to him. As we walked together over the mountains, or by the banks of the creek or stream, down in the wooded valley, my companion would point out to me, with a half-regretful pride, where "big strikes" had been made in former times. Pointing to a ruined log cabin, out of which a cayote wolf rushed, he assured me that the owner had washed some forty thousand dollars out of a patch twenty or thirty yards in extent. Cañon Creek, the locality in question—it must be familiar to many of my readers—is a fit specimen of many similar localities all over the Pacific coast. It was one of those "dead cities," the weird associations of which have been introduced into a well-known work. In Tuolumne County, California, are very many such. "We lived," writes a graphic and humorous writer, though in this case the description is soberly in earnest, "in a small cabin on a verdant hill-side, and there were but few other cabins in view over the wide expanse of hill and forest. Yet a flourishing city of two or three thousand people had occupied this grassy, dead solitude during the flush times of twelve or fifteen years before, and where our cabin stood had once been the heart of the teeming hive, the centre of the city. When the mines gave out the town fell into decay, and in a few years wholly disappeared—streets, dwellings, shops, everything—and left no sign. The grassy slopes

were as green and smooth and desolate of life as if they had never been disturbed. The mere handful of miners had seen the town spring up, spread, grow, and flourish in its pride; and they had seen it sicken and die, and pass away like a dream. With it their hopes had died, and their zest of life. They had long ago resigned themselves to their exile, and ceased to correspond with their distant friends, or turn longing eyes towards their early homes. They had accepted banishment, forgotten the world, and had been forgotten of the world. They were far from telegraphs and railroads, and they stood, as it were, in a living grave, dead to the events that stirred the globe's great populations, dead to the common interests of men, isolated and outcast from brotherhood with their kind. It was the most singular, and almost the most touching and melancholy exile that fancy can imagine. One of my associates in this locality for two or three months was a man who had received a university education; but now for eighteen years he had decayed there by inches, a bearded, rough-clad, clay-stained miner, and at times, amid his sighing and soliloquising, he unconsciously interjected vaguely-remembered Latin and Greek sentences, dead and musty tongues, meet vehicles for the thoughts of one whose dreams were all of the past, whose life was a failure; a tired man, burdened with the present, and indifferent to the future; a man without ties, hopes, interests, waiting for rest, and the end." Cañon Creek was such a place as that so graphically described in this extract. It had been, I was told, once a "bully old diggin'," but the stream having been pretty well washed out, the miners had decamped to parts unknown, leaving no address behind them. Like the Arabs, "they folded their tents, and silently moved away." Here was a half-ruined building, choked up with weeds, bearing record that it had been once the "El Dorado Saloon"—in other words, a gambling hell, or worse—and around it were a few cabins. This had been the town site, and the projectors no doubt imagined that it was to be "the right smart chance of a city." However, fate had decided otherwise, and the only traces of former greatness to be seen were piles of washed stones and gravel, and long trenches, and half-ruined ditches, which gave the spot the appearance of a place where some great engineering operations had been left half finished. Here and there a solitary Chinese slunk about, intent on his own business, and, if my companion was to be believed, in pursuit of stray cats. As we turned a corner of the rough trail we suddenly emerged in front of the store. By the door were sitting half a dozen of the old *habitués* of the creek, lazily talking. My friend was delighted. "There they are," he cried, "loafin' about, chawin' baccy, jest as nat'ral as anything!" He seemed to be a popular man among them. As his friend—friendships are quickly made in the West—I was received with vociferations of welcome, and the choice of half a dozen shanties to "spread a blanket in." In this way I saw a good deal of the honest miner of Cañon Creek, and learned not a little of his ways of life and thought, in this lonely little dell in the Siskiyou mountains. Of course, we have all read about the miner in California, British Columbia, or Australia; about his extravagance, his boisterousness, and his conduct generally; and we are too apt to think of him only as the roystering blade in the palmy days of 1849 or 1853, when gold could be had for the picking up. The typical miner in 1884 is a very different man from that of 1849, even though he be the same individual. No longer do you, as a rule, see the many fine-looking handsome fellows of the early days of California twenty

or twenty-five years ago. They were all young men then, but hardship has told upon them: for, in many cases, they have pursued, with varying luck, that business of gold-digging ever since. The 'forty-miners are the "blue blood" of the coast, but they are proverbially poor. Accordingly, these men, among whom I associated on Cañon Creek, were very different from our usual notion of the gold-miner, but were yet at the same time very characteristic types of what is well known on the Rocky Mountain slopes as the "honest miner." He differs in many respects from the settler of late years. Enter his cabin, and there is always indubitable evidence of that miserable life of single blessedness with which Bret Harte has familiarised his readers. The gold-digger is almost universally unmarried. The rough blanket-spread cot; the axe-hewn table, with its scanty array of crockery; the old battered stove, or fireplace, built of clay and stones; the inevitable sack of flour, half sack of potatoes, and junk of pork; the old clothes and old boots, and a few books and newspapers, go far in making out the extent of the miner's worldly possessions. A little patch of cultivated ground, enclosed by old "sluice-box" lumber, is sometimes an accompaniment, as well as a dog, a cat, or a few fowls. The inhabitant of this cabin is often rough, grey, and grizzly. He came out twenty years ago, and his residence has, with few exceptions, always been on the gulch where we now find him. Probably it rejoices in the euphonious name of Horse-beef Bar, Bull-dog Forks, Jackass Gulch, Rough and Ready, Rag Town, Puppy Town, Love-letter Camp, Jim Crow Cañon, Gospel Gulch, Gouge Eye, Shirt-tail Bar, Bogus Thunder, or Ground Hog's Glory—all veritable localities. By one of these names his home may or may not be found on the surveyor-general's map, but at all events it goes by no other. He "does his trading" at a store at Diggerville. Credit he calls "jaw-bone," and talks about "running his face" for "grub," but sometimes this is objected to by the storekeeper, as the gulch is not "paying" well, and behind the counter you may see a mule's "jaw-bone" significantly suspended, and below the words "played out!" Here the honest miner purchases a few pounds of flour, a little tea, coffee, and brown sugar, and as much whisky as he can buy. He can tell where all the rich spots have been in the rivers, bars, gulches, and flats; but that was in the glorious, wicked, cutting, shouting, fortune-making times of yore. He can't tell where there are any rich spots now. He is certain there is a rich quartz ledge in the mountain yonder, and, if he could get water on the flat, he is sure it would pay good wages. Excess of fortune spoiled him in '49. Economy is a myth with him, and he cheerfully entertains half a dozen friends, though his magazine of provisions, as well as of money, be in an advanced state of exhaustion. His supper cooked, he thinks of home—that is, the home of twenty years ago. In reality he has no home. Mentally, he sees the faces of his youth, fresh and blooming; but they are getting old and withered now. He sees the peach orchard and the farmhouse, from which he wandered, a young rover, when first the news of golden California burst upon the astonished ears of the world. That home is now in the hands of strangers. Were he to "go East," as he calls it, he would find himself a stranger in a strange land. He thinks he'll go back "some time or other." Fortune occasionally favours him a trifle more than usual; and then he may make a trip to "the Bay," as he calls San Francisco. He stops—or he did in my day—at the "What Cheer House." He may be seen there by hundreds. Poor fellow! He came here to enjoy himself, but he doesn't well know

how. The novelty of the city wears off in a day or two. Without occupation, his routine of life broken, he becomes a victim to a disease for which the French alone could have invented a name—*ennui*. At night he may go to the theatre; but by day he sits in rows in the hall of the hotel, crowds the entrance, and sometimes blocks up the street. If he have money enough, and be so inclined, he may “go on the spludge,” and possibly get drunk; but that with this class of miner is not very likely. His face wears an expression of

SACRAMENTO STREET, SAN FRANCISCO.

wild bewilderment and intense weariness. Unaccustomed to the hurry and bustle of the city, he “collides” frequently with the denizens of the metropolis. The spruce, fashionably-dressed, frizzle-headed clerks who flit by excite in him feelings of contempt and indignation. For all “airs” and “frills” he has an honest disdain. The swarms of youthful females in the streets astonish, delight, and tantalise him. They are something so new to him. There are few on Jackass Gulch, and the few would be better away. When he knew “Friseo” it was not much more than a collection of cotton tents on some sand-hills. Now it is a fine city of 240,000 inhabitants. Females were almost unknown, and the announcement

by a steamboat proprietor of "four lady passengers to-night" was quite enough to ensure a crowded patronage for his vessel. But the digger of the auriferous soil often leaves the city with the knowledge that the world has gone far ahead of him during his lonely residence in the mountains. He had far better not have come. In Diggerville he is somebody. In San Francisco he is lost among the crowd, or at best is only a "rusty old miner," those who thus contemptuously talk of him forgetting that he and such as he were the founders, and are yet, to a great extent, the stronghold of California.

I have spoken of the deserted villages, and the melancholy wrecks they have become. "You may see," writes the same author I have already quoted, and I can vouch for the accuracy of his statement, "such disfigurements far and wide over California, and in some places where only meadows and forests are visible, not a living creature, not a house, not stick or stone, or remnant of a ruin, and not a sound, nor even a whisper, to disturb the Sabbath stillness. You will find it hard to believe that there stood at one time a fiercely-flourishing little city of 2,000 or 3,000 souls, with its newspapers, fire company, brass band, volunteer militia, banks, hotels, noisy Fourth of July processions and speeches, gambling hells, crammed with tobacco-smoke, profanity, and rough-bearded men of all nations and colours, with tables heaped with gold-dust, sufficient for the revenues of a German principality, streets crowded and rife with business, town lots worth 400 dollars a front foot, labour, laughter, music, dancing, swearing, fighting, shooting—*everything* that delights and adorns existence; all the appointments and appurtenances of a prosperous and promising young city; and *now* nothing is left of all but a hopeless, homeless solitude. The men are gone, the houses have vanished, even the *name* of the place is forgotten. In no other land in modern times have towns so absolutely died and disappeared as in the old mining regions of California. It was a driving, vigorous, restless population in these days. It was a *curious* population. It was the only population of the kind that the world has ever seen gathered together, and it is not likely that the world will ever see it again. For, observe, it was an assemblage of 200,000 young men—not simpering, dainty, kid-gloved weaklings, but stalwart, muscular, dauntless young braves, brimful of youth and energy, and royally endowed with every attribute that goes to make up a peerless and magnificent manhood, the very pick and choice of the world. No women, no children, no grey and stooping veterans, none but erect, bright-eyed, quick-moving, strong-handed young giants, the strongest population, the finest population, and the most gallant host that ever trooped down the startled solitudes of an unpeopled land. And where are they now? Scattered to the end of the earth, or prematurely old and decrepit, or shot or stabbed in street affrays, or dead of disappointed hopes and broken hearts—all gone, or nearly all, victims devoted upon the altar of the golden calf, the noblest holocaust that ever wafted its sacrificial incense heavenward. It is pitiful to think upon." It will be easy to amplify this text by a thousand instances and strange tales. But the subject is unpleasant. It is too saddening. Let us turn from it.

I fancy that I do not really wrong the honest miner in saying he does not possess much religion. Yet if a clergyman by any chance come into his camp, he makes a point of attending "meeting" on much the same principle, and with feelings of about equal reverence, with which he would go to a dog-fight, or a tight-rope performance: because

he looks upon it as "the right thing" to *patronise* "the affair." If the parson look on as he is washing for gold, he will ask him if he would like to "wash out a pan?" and as this invitation is usually accepted, the worthy fellow will contrive to slip in among the gravel a tolerable nugget, so that the washer may be nothing the worse for his clerical visit, custom in such cases providing that the contents of the pan go to the visitor. A friend of mine, whose lot it was to officiate as a clergyman among them at one time, used often to tell me that he had to ring a bell in the morning along the apology for a street, inviting his parishioners to divine worship, and that, finding nobody in church when he came in, he first looked into one gambling saloon or tavern, and then into another, inviting the company to come to church. "All right, parson," would be the good-natured reply; "we'll be there as soon as we've played out this hand for the whiskies. Jest be goin' ahead, and we'll be along for the preachin'!"

I have spoken of the miner's propensity to "take a drink." This taking of "drinks" is one of his characteristics. No bargain can be made, or any other matter of business or sociality settled, without the indispensable "drinks." The same clerical friend, whose experience I have just related, was shocked on his first arrival among the miners at being asked to "stand drinks," after he had received a very liberal subscription towards the building of his church. Two mining companies that I know something about threw dice to determine which of them should treat the "whole creek" to champagne, and as that wine was sold at fifteen dollars per bottle, the cost to the loser may be guessed. In most mining localities it is looked upon as a cause of mortal offence to decline drinking with the first man who shouts, "Let's put in a blast, Cap.!" In some places it is quite a serious breach of etiquette not to ask all who are sitting round in the bar-room of a tavern, though total strangers, to "Step up and take a drink." Sometimes they do not require any invitation. An acquaintance of mine having had a long ride one day, dismounted at a tavern to take, *more Americano*, some refreshment, when, to his utter astonishment, fourteen men who were sitting around stepped up, and "lowed they would take sugar in thar'n." He paid for the fifteen "drinks," as it was in strict accordance with the custom of the country; but he took care not to go back to that hostelry again. The Australian gold-digger is in many respects different from the Californian, but still he evinces the same carelessness of money. It used to be the custom for these men to come down to some village after they had made a slight "pile," go each to his favourite public-house, and give the money into the landlord's hands, with an intimation that he was to "shout" (or ask all and sundry to drink) until it was finished. Then the landlord at intervals would say, "Step up, boys, it's Jim Jenkins's shout!" Then they all wished Jim luck, until Jim's "shout" was out, and then he went back to his "gully," proud that he had "spent his money like a man." On one occasion a miner came down and handed his money over to the landlord; but, contrary to expectation, nobody would respond to his "shout." He had been a convict, and "lagged" for some grievous offence. The man was at his wit's end. At last he struck upon the brilliant expedient of engaging an idler at labourer's daily wages—eight shillings—to drink with him. And thus he got through his holiday.

No one can tell where a rich mine will be discovered, or where it will not. Even

quartz mines, which require skill to diagnose, have been equally discovered by chance. Geologists were never more successful than other people in this search, or than those ignorant of "veins," or "dykes." A robber fired at a man standing with his back to a rock, but missed him. As the ball splintered the moss-grown quartz, the miner who was attacked saw specks of gold sparkle in the moonlight. It afterwards proved one of the richest mines in California. Two miners about to leave the country, and in despair, just to celebrate the event, "got on the splndge"—to use their own expression—the night before their intended departure. As they were coming home to their cabins, in mere foolishness they commenced rolling stones down a slope. One of these struck the point of a rock, which, on being examined, was found rich with specks of gold. This changed their plans, and they stayed and stayed to some purpose, for they afterwards became very wealthy men. The "honest miner" is far from being a domestic character. If he was making five dollars per diem "to the hand" at "Greaser's Camp," and heard that somebody else was making six at "Hellgate Cañon," in "Mountain Goat Gulch," the chances are that he would presently make his appearance at the new El Dorado. Now it was Gold Bluff to which all were rushing. That failed, but it did not dishearten the failures. They next rushed in thousands to Gold Lake. In 1855 the Kern River fever raged; and in 1858 came the "Fraser River rush," seizing the Californian miners like a frenzy. Few were very successful, and most of them came back—to use their own term—so "strapped" that eventually it became a matter of personal offence to ask a man if he had ever been to Fraser River. But he was not cured. In 1863 the infuriated searcher after gold was blocking all the mountain trails in the Sierra Nevada Mountains, and "Washoe" was the cry. In 1864 it was Blackfoot, and in 1866 I saw hundreds rushing through slush and snow for Big Bend, in British Columbia, declaring that Cariboo and Stickeen, all former "rushes," were not "a patch on it," and that, at all events, they would "see the elephant." This vagabond propensity will fasten on a man who allows himself to sit in front of a frying-pan and a bundle of blankets, on the ridge-pole of a sore-backed horse; and I verily believe that there are many men among the gold-diggers who, if their history were known, have travelled more and endured greater hardships than some whose names are famous in the annals of vagabondism, and whom the Geographical Society delights to honour. The true seeker after El Dorado does not stop at distance or difficulties. The Pacific gold coast miner does not care to be called, like the Australian, a "digger," this term in the former region being applied to, and associated with, the lowest race of native Indians. He likes to be called the "honest miner." That he is honest enough, as honesty goes in North-West America, nobody will deny to the profession as a whole, but still there is occasionally the "dishonest miner" too. We do not speak of the rascal who is caught stealing gold out of the "shice-box," and gets lynched for his pains, but of the equally rascally individual who "salts" a claim before selling it—that is, he scatters a few pieces of gold through the gravel before the buyer comes to test it. In California some of the "claims" are wrought summer and winter. Indeed, the winter is there more favourable than the summer, because water is more plentiful. In the hot weather California "dries up;" but in British Columbia, near the Rocky Mountains, the frost causes work to be suspended. Then the claims are "laid over," and

the great body of the miners come down to Victoria and other towns to pass the winter months, and to spend the money they have made during the summer. They also often try to dispose of some rather doubtful "claims" at this time, and one of the means adopted is to report "having struck a good prospect" just before leaving. It is remarkable, to say the least of it, how many good prospects are "struck" just about this time. The endless swindles connected with quartz companies are leaving painful records in the memory of certain gentlemen in the City of London and elsewhere, whose purses were

MINER'S CABIN BY THE AMERICAN RIVER, CALIFORNIA. (From an Original Photograph.)

larger than their foresight. Gold-mining will always be a staple industry of the Rocky Mountain slope, and the increased immigration and attention excited by the Pacific railroads will greatly increase the business; but the old miner will be "killed off." Large companies will work his "claims," and shoals of new faces will crowd the yet solitary valleys—Philistines who know not the old traditions, and have no sympathy with the old manners and the old men. He will himself meet them half-way, as the fur-traders and trappers have done, and will unconsciously lose many of his characteristics and peculiarities. He will get toned down to the duller routine of other workmen as his pursuit takes its place among the "industries."*

* See also the author's sketches of Rocky Mountain Men and Manners in Dickens's *All the Year Round*, *The Field*, *Field Quarterly Magazine*, &c., for 1869 et seq.

MAIL DAY IN THE WEST.

To describe the many curious phases of life which the Farthest West now presents, and did present even more markedly before civilisation trod so fast on the heels of barbarism, would be beyond the powers of the space at our disposal, agreeable as would the task be to the writer, and possibly interesting as it might prove to the reader. The trapper and the fur-trader, the voyageur and the gold-digger, we have already briefly sketched. To complete a picture of the typical men of the Rocky Mountains and Rocky Mountain slopes, we should require to devote some space to the frontier man "who is always moving West"—his simplicity and his shrewdness, his savage likings and rude ways, and yet his kindness of heart, and his rough hospitality—to the "loafer" and the "bummer," disreputable specimens of the genus *Homo*, neither peculiar to America, nor yet to the Pacific Coast section of it, though now, owing to the miner's lazy, good-natured tolerance of everything and of all men, found there in greater abundance than elsewhere; to the ruffian, "road agent," or desperado, who finds his uncertain home in the midst of the "society" of the men of all nations who resort to gold countries; but most of these types we must perforce pass over. I cannot, however, leave men and manners in this region without giving a brief sketch of some once peculiar to the Pacific Slope, but which, year by year, are getting rarer, and will soon disappear. In describing the mail day and mail arrangements of the country, from California to British Columbia, an opportunity may be afforded for saying something about the many sharply-hewn individualities which the hard life of these regions has scattered through it, among the less characterised streams which older civilisations have poured into the provinces, territories, and states of Western America.

Bang! It is a dull sound, as of a cannon, which wakes us out of our sleep on four bearskins under a blue blanket and an old coat in our "shanty," or cabin, in Victoria, Vancouver Island. We are as yet new to the ways of the place, and rub our eyes wondering what it can all mean. While we are cogitating, we hear the scuttling of many feet along the wooden "side-walk;" and the companion who, for the time being, shares our mansion, rushes in, dressing as he makes for the door, and tells us to "hurry up," for the mail is in. "Hurrying up" means, in this case, jumping into some clothes and a pair of boots, and joining the people who are now running from hither and thither down the quiet streets towards the harbour. It is yet early morning, but half the population seem to be up, and all going one way. The hotels, and many private and business houses, are flying flags. You also notice that, though this is nominally a British town, fully one half of the colours are American. Our Transatlantic cousins are "great on bunting;" and on high days, holidays, and on steamer day, are in no way backward to display the "goose and gridiron" to the breeze. There is the mail steamer from San Francisco lying alongside the wooden wharf, blowing off steam, and already surrounded by draymen, black and white, all shouting, most of them swearing, and not a few of them with gold watches in their sleeved-waistcoat pockets. Remember that we are in El Dorado. The chief citizens are also down deep in conference—three deep—with the purser, who, cigar in mouth, is busy with invoices and bills of lading, while

here is paterfamilias, much excited and very hot, seeing to the landing of his wife and family, whom at last, having prepared a new home for them, he has brought away from struggling, overstocked England. They look very happy, but wondrously bewildered, at the new scenes around. And yonder is a sweet English girl, who has come all the way from fair Devon to pine-clad Vancouver, to wed the Bidesford lad who has been toiling in the mines all these years for her; and as we see that brave lass escorted by the happy lover, and the brother who has come out with her, to the Hôtel de France, and thence to the little wooden church upon the hill, we feel certain that all the world looks bright to them, and all the mean-looking board houses gilded palaces. There are also idlers like ourselves, seeing if any acquaintances have come, and what "new chums" have arrived for our colonial society. Here seems to be a popular man, who has just come out of the steamer. Half a dozen young fellows are round him, and he is laughing and shaking hands. He seems an old colonist, who has been away on a visit, and has returned again. "Glad to see you, boys," we hear him saying, "mighty glad! Tell you what, the old country's not what we thought it, and I'm glad to be back from their small twopenny-halfpenny-wheelbarrow ways. I'm going to stick here, I tell you, and I guess you'd better all do the same!" The incredulous, sad-looking smile on some of these young English faces show that they don't half believe the enthusiastic returned colonist, and then we hear one say to the other, "Ah! it's all very well for Stephens, with his town lots and Cariboo claim; but I guess if I'd got his chance, you'd soon see the last of this child!" Nevertheless, they all go up and "take a drink" with the jubilant Stephens in old Ben Griffin's, at the Boomerang. There is already quite a brisk business going in that same way. "Ben's" seems to be the English house, and there the newly-arrived Briton may, while quenching his thirst, indulge in the new arrival's amusement of abusing the "Yankees" to his heart's content, without any fear of ulterior consequences. It seems apparently etiquette for the new arrivals and the "old hands" to go and "take a drink" before starting into the serious work of breakfast. Nobody has, however, much time for breakfast to-day. Even the lazy—the serenely lazy—Indians are now too excited to sit on the "side walks" lazily watching the busy multitudes of pale-faced strangers. Even they are down at the wharf acting as porters to the different hotels, for omnibuses and cabs are as yet unknown to Victoria. We get clear of the drays, and trunk-laden aborigines, and go up to the post-office, a little wooden building which also does duty for the harbour-master's office, for the Postmaster-General, being at that time an old sea-captain, was made by an economical legislature to do duty also as captain of the post. The postman's knock, so familiar to us at home, is quite unknown on this secluded coast. Here everybody goes to the post-office for his own letters. Accordingly, by the time we have reached that building, merchants and merchants' clerks, or men who have boxes in the office, for which they pay a round sum per annum, are rushing for their "mail matter," as it is called. The general public have, however, the advantage of no such aristocratic luxury, and are forming in line to await their turn at the office window. This arrangement, from long custom, has become familiar to the heterogeneous mob who are waiting outside. Noiselessly, and without any nonsense, each new comer takes his turn

at the end of the single file, until it reaches in a long *queue* up Wharf Street, or away towards the Hudson's Bay warehouse. Now and then, indeed, some more than usually bumptious individual will attempt to step into the line out of his order; but he speedily becomes convinced of the little mistake he had made as he is politely but promptly handed back, until, to his astonishment, he lands at the end of the tail. If the mail arrives when the town is full of gold-diggers, it will sometimes be hours before the last of the human *queue* can reach the head of the line; and though he need never attempt to go out of his place, it lies quite within his purpose to effect this by love or money. It is not often that he attempts to do so by the former means; the latter comes more within the bounds of possibility. Accordingly, you are almost sure to see in the line now and then some tall, gaunt, grey-shirted fellow who, you are perfectly certain, expects no letter, and who is in no great hurry. At a wink the individual to whom a letter may be of importance buys him out, and takes his place in the rank. In San Francisco, in the old roystering, money-scattering days, ten dollars were often paid for this favour.

At last we are near the head of the line. There are still two before us, and we take our cue from them. Number one presents his head at the opening in the boarded window—"Boek, Hiram J."—this in a nasal accent. The Postmaster-General is assisted by the Deputy Postmaster-General—we are fond of titles in the colonies—and both rapidly turn over the piles of letters arranged in the pigeon-holes under the different letters of the alphabet. "Nothing;" and Hiram J. Boek, late of Martha's Vineyard, Massachusetts, turns away, and eats a chew of tobacco to console him for his disappointment. Number two is absorbed in an exchange of compliments with an individual behind him who is kicking his shins, and requires a peremptory shout of "Next man!" to remind him that the "Honourable gentleman" at the window requests his order. He darts forward and shouts—not in the half-whispering tone of some modest individual, but after the manner of a free-born Briton—"Smith!" "What Smith?" "John Smith!" A laugh comes from the inside, as the Postmaster takes a peep at his man, and asks, "What John Smith?" A little altercation ensues, which seems settled to their mutual satisfaction, for John Smith lays down three bits—about eighteen pence—for some partially paid letters, and moves off with "his mail." We come next, and so the line goes on. The newspapers are not distributed to-day. There is no time for that. The "newspaper men" are, however, in the room behind, looking over the pile on the floor for their "exchanges," and I daresay not very particular in making use of any tempting periodical, even though the address on it should not be theirs. Perhaps it is only in the United States and in the British provinces on the Pacific that private individuals are allowed to compete with the Government in carrying letters. These are called "Express companies," and one or other has an office in every place of any consequence all over the country. These Express companies usually conduct a banking business, commission agency, and are also carriers of parcels—in fact, general factotums. The chief of these is Wells, Fargo, and Company, or as they are familiarly called, "Wells Fargo." In every large town Wells Fargo's office is one of the best situated and most substantial buildings. If anybody be in difficulty about getting anything to or from any place he goes to Wells Fargo. Nobody, so far as I am aware, ever saw either of the gentlemen so called; indeed, some profane

VIEW OF "THE GORGE," OR NARROWEST POINT OF THE WESTERN PROLONGATION OF VICTORIA HARBOUR,
VANCOUVER ISLAND, WITH TREES OF *ABIES DOUGLASII* (From an Original Photograph.)

individuals will not hesitate to hint that they are of the nature of two Mrs. Harrises, but, at all events, everybody knows their representatives. Many people, Americans especially, have a most enduring belief in them, and prefer to send their letters by them rather than through the post-office, even though the former mode of conveyance is more expensive. All you have to do is to go to their office, buy one of their envelopes, put your letter in it, and then hand it over to them. You may be almost certain that it will be delivered to your correspondent more safely, and, probably, quicker than it would be if committed to the hands of the postal authorities. The agents of these Express companies travel far and near, and often to places where there are no postal arrangements. Through the wildest parts of the country you will meet them in canoes, on horseback, in stage-coaches, all bound on the same errand, carrying treasure, parcels, and letters. The mining population could scarcely exist without them, and have a most unwavering faith in them, I believe in every case well founded, for I have known very few things committed to their hands go astray. Though, perhaps, the mail coming to Victoria from England by Wells Fargo will be small compared with that by the legitimate channels, that leaving by them will be nearly as large, and to San Francisco probably larger. We step up accordingly to Wells Fargo's office in Yates Street to see if there are any letters for us there. The large room is full of people. The agent is standing upon the counter with a pile of letters, alphabetically arranged, in his hands, shouting out the different names, and tossing them hither and thither with an adroit spin, learned by long practice, in the direction of the applicant. The only person at all idle there on this busy day seems to be the captain of the steamer, who is sitting quietly in the Express office sanctum reading the colonial papers, and now and then nodding to his friends.

To-day you need never attempt to speak to any man on private business. Under ordinary circumstances anybody in Victoria must be unwontedly busy if he has not time to "take a drink," but to-day unless it be in the way of business, nobody has leisure even for that, or to do anything but read his letters, and write hasty answers to his correspondents. The provincial legislature by silent consent never think of meeting on mail day, and the Honourable John Jones must perforce postpone that great attempt to overthrow the government on the momentous subject of the Hog and Goat Bill, until he has written a smart note to Gingham, Cheatem, and Co., of Manchester, about the quality of that last invoice of long shirtings. Even Her Majesty's Courts of Justice must put off the trial of the Hydah Indian for murder until the mail is gone. The Chief Justice is, besides, too busy signing various legal papers to-day to attend to his ordinary judicial functions. The sheriff—and the functions of a colonial sheriff are more useful than ornamental—is very busy, for he knows, by long experience, that on every mail day a number of gentlemen who may be in pecuniary trouble are apt to give their creditors the slip, and bid farewell for ever to an ungrateful colony. This intention comes to the sharp ears of their anxious friends in the way of business, and instantly these gentlemen rush over to the chief justice, and swear that to their certain knowledge such is the intention of the individual aforesaid. A *capias*, or "cap'us," as it is familiarly known among those accustomed to it, is then issued, ordering and commanding the sheriff to see that So-and-so—*ne erant regno*—does not, in a word, abscond, to the loss of his mourning creditors. In the course of

the afternoon the sheriff and his myrmidons may be seen hanging about the steamer armed with these bits of paper, and then between wanted and wanter there is a fine trial of skill, and not unfrequently, by a display of careless nonchalance, the victim slips from under the watchful fingers of the legal functionary. On mail day bills become due, and as everybody has his bills to meet on that day, everybody expects everybody else to pay what he is due. But, of course, as always happens in these cases, the creditor frequently reckons without his host. Accordingly, the steamer gun is at times the signal for gentlemen who "have something out" to have a particular engagement in the country until the mail has gone. In San Francisco, before the steamer day was superseded by the Pacific railroad, this necessity of making up bills against steamer day gave rise to a peculiar set of men, who made a business of lending money "from steamer day to steamer day," the rate for the ten days or a fortnight being from one to two per cent., almost invariably also with "collateral security," that is, a deposit receipt for merchandise in a warehouse, or some such easily transferable document. This was rather exorbitant, even in a country where the ordinary interest on money, with good security, is eighteen per cent. per annum. But then at no time in California has it been looked upon as dishonourable either to lend or to borrow money at the highest rates of interest, and the "from steamer day to steamer day" money lenders grew rich.

The newspaper offices are full, for the different local journals issue a special edition for steamer day, containing a summary of the last ten days' or two weeks' news, and people are busily buying these at one shilling a copy, in the sanguine hope, cherished in spite of many failures, that they will reach the persons to whom they post them. As we pass down by the post-office again, most of the town people have received their letters, but the settlers from the immediately outlying districts have begun to come in. You notice that nearly all of these people, though roughly dressed, are yet of quite a different style from our familiar agricultural labourer. Most of them have an air of intelligence, and several are even refined in appearance, manners, and language. For months these men have been shut out from all news from home. Some have just come down from the mines, and you can see by the look of them have been unsuccessful. Others are "putting through the winter" as best they can, hunting, working on farms, or living from hand to mouth until the snow clears off the mountains, and they can start off to try their luck in the gold-fields once more. Some, as they receive their letters, cram them into their pockets, and move away to some quiet place to read them, while others, all careless of the throng, move along Wharf Street and up Bastion Street, diligently perusing the long-expected missive. Another will comfortably sit down on the edge of the wooden "sidewalk," with his feet in the gutter, and, heedless of passers-by, peruse his correspondence from beginning to end. A nervously excited man will open his letter, peep into it, and then rush off to devour it in the quiet corner of some neighbouring "saloon," or public-house; and now and then you will see an anxious face, and notice often a tearful eye glancing at a deep black-edged envelope, which tells that one more link which bound the far-off colonist to the mother country has been severed.

As the hour for the steamer sailing approaches, the whole town gets into a fever of excitement; and when the whistle begins to blow in a spasmodically shrieking manner,

and the black clouds of smoke which announce that steam is getting up, darken the air, you would suppose that the end of the world-colonial was approaching. Here a returning colonist, surrounded by a knot of envious friends, and with an air of pity on his face for us who are remaining, is rushing down to the steamer, or hastily taking the inevitable farewell "drink" before shaking the colonial dust off his colonial highlows, while every other man seems to be rushing with a letter for somebody to post in San Francisco, having been too late for the mail. At last the steamer begins to ease off, then the crowd give

VIEW OF THE WESTERN SUBURBS OF VICTORIA, VANCOUVER ISLAND. (From an Original Photograph.)

a cheer or two, which is returned with interest from the crowded deck of the steamer. Steady! and she is round the arbutus-covered point by the Indian village, the crowd turn off, and once more we Vancouverites are left to ourselves, and mail day is over for the next fortnight.

Only the day's work is not over for the journalists. A hasty dinner swallowed, the colonial sub-editors grind up the editorial scissors, and set to work to get up the summary of European news, while, perhaps, an idle friend may look over the exchanges, and make up their foreign correspondence in Paris, Vienna, or St. Petersburg, with a sufficiency of local colouring derived from experience, or from Murray's Guide Books. Next day the night's work will appear pretty well put together, with lists of the passengers, the imports and exports, the amount of gold-dust despatched by each banking-house, and a variety of notices

headed "Personal." These note that "we are glad to see" that such and such a distinguished citizen "has again arrived home, and looking well after his visit to Europe," or that such and such another citizen, also distinguished after a fashion, had, to the regret of his numerous creditors, managed to elude the active and vigilant sheriff. Then follow a list of acknowledgments, "To the gentlemanly and obliging purser of the steamer *Brother Jonathan*, for late San Francisco papers," or to "our eminent citizen, Hon. Donald Macdonald, who has just arrived from a prolonged visit to Canada, for late Dominion

ENCAMPMENT ON THE PLAINS, WESTERN UNITED STATES (NEAR FORT HALL).

(From a Photograph.)

exchanges." In a few days things settle down to their ordinary dead level. The gentlemen "wanted" get at their ease again, while the citizens who had "something out" return again to town, of course terribly shocked to hear that the mail had been in and gone. Until the great mail day arrives again the even tenour of the mercantile way is undisturbed, except by the arrival of a few local mails "up river," or "long coast local steamers, smaeks, and trading schooners, or by the still more primitive conveyance of an Indian canoe.

It is not difficult to remember when this latter method was the only postal convenience in the country; but that was when the Honourable the Hudson's Bay Company reigned

supreme over these territories. At that time the only civilised spots through this immense tract of country were the forts of the great fur-traders. When the officer in charge of one of these lonely outposts wished to send a letter to another fort, he merely sought out an Indian, wrapped the letter well up in a piece of oil-cloth, and despatched him. There was a stated rate of remuneration, according to the season of the year, for this service, and this every Indian knew. Accordingly, the aboriginal courier might go the whole way and receive the whole reward, or—what was much more likely—he might not have his way all clear before him, and prudently stop as long as his skin was whole, or his scalp intact. In that case he sold the letter to another Indian for a share of the reward, proportionate to the distance yet to be gone over. To the Company it was quite the same, for eventually the letter reached its destination in safety, when the full payment was claimed by the contractor for the last division of the route traversed. In those days the one annual ship to Fort Vancouver took about twelve months on the passage from England. It halted to take in wine at Madeira, coffee at Rio, cattle at the Falklands, at Valparaiso to water, at the Sandwich Islands to trade tortoise-shell, and at San Francisco to bribe Don Castro, the Mexican governor—all before the gun from Astoria reported that she had passed the bar of the Columbia River. Then she went to Canton and sold her sea-otters to the mandarins, and bought nankeens, teas, and silks, and so made the round voyage. Accordingly, the Company adopted another method to send their letters and the rarer furs more quickly to England. Every year the fur brigade crossed the whole breadth of the American continent on foot, on horseback, in birch-bark canoes, and in batteaus to York Factory, in Hudson's Bay. The accountant of the Company then soldered up the papers in a shining tin box, which he strapped on his back, and—the observed of all observers (the tin box, not he)—Fort York, or Moose Factory, as the case might be, was reached in about five months from Fort Vancouver. These were the primitive days of the postal system in the Far West.

We thought we had got an immense advance when the pony express carried the letters by relays of fearless riders over the plains to the Farthest West railway station, and thence returning to Sacramento, in California. I can well remember the steamer lying puffing at the wharf at Sacramento until elatter! elatter! the last pony-rider, a rough, hardy, wiry fellow armed *cap-à-pie*, galloped on board with the mails from "St. Joe's" (Saint Joseph), in Missouri, apologising to the little knot that gathered round him by the funnel for keeping them waiting, by relating (as he lit a cigar) that "a mile or a mile and a half on this side of Brown's Hole, down by the sulphur spring, Joram Hicks, the pony-rider, had got his har lifted by Pah-utes, and it was 'nation time, boys, afore the stock could be got up, and the bags ketched from the critters and sent on!" And the speaker went off as unconcerned as if he were relating the most trivial incident in the world. But it was a very trivial incident in those days, for one who did business on the great prairies to lose his scalp between sunrise and sunset. Then came the stage-coaches—such as we have figured on page 25—and everybody thought the end of the world could not be far off, when you could, by travelling day and night, and getting the life almost shaken out of you amid a cloud of dust, go

from Virginia City to Omaha in seven or eight days. Now you can go from New York to Sacramento, in luxurious carriages, in less than that time. Still the stage-coach is, and will long be, an institution in many parts of the West, both for passengers and mails. It will long remain the most civilised mode of reaching the remoter diggings until railways are general, which will be a long time. There was such "a stage" going between Portland, in Oregon, and Marysville, in California, within the last few years. In the winter it had to be ferried over swollen rivers on rafts, and often, when crossing prairies which, when flooded, look like great lakes, the passenger suddenly became aware that the coach was floating, and that if he didn't look sharp he'd be drowned like a rat in its hole. How long it took I should be afraid to risk even a conjecture. Rumours—probably unfounded—are extant of a too confiding person having died of old age on the road! Still, I can vouch that a journey by it used to be very amusing—after it was all over.

Even after the overland coach began to run, mail day was still an institution in San Francisco, only a limited mail being conveyed across the plains. Then, among other things, the Eastern (U.S.) papers always sold for a shilling (twenty-five cents, or two bits) a copy. Somehow or other the mail used to manage, nine times out of ten, to come in after dark, and often at very unseasonable hours. Often when coming home from some pleasant party, at an early hour in the morning, the quiet streets would resound with the yells of the newsboy (and a California newsboy is the sharpest of his race), "Pa—nama st'm'r in. *Noo For—the Herald, Tri-bune, World*. Here you are, sir! two bits!" and he was off again to intercept some other reveller on the opposite side of the street. You hurried home, lit your lamp, and prepared to extract what enjoyment there might be in the journal purchased, until, as you unfolded it, a sort of suspicion began to steal over you that there must be some mistake. The paper was a year old! Then, as you dashed it aside, recollection dawned that this was the 1st of April, and that in buying a paper you had yourself been sold!

In addition to all these methods, a good number of letters, in the most out-of-the-way places in the Far West, are carried by private hands. There are localities so remote, that even the stage-coach is not heard of, and the express-man does not find it worth his while to reach them. Letters from such places are, as might be expected from what we have learned of the lonely position of some of the fur-trading posts (Vol. I., page 194, &c.), few and far between. There are also distant knots of gold-diggers in some secluded mountain valley, washing the sands of a nameless stream, who might quietly slip out of men's memories, did they depend upon Government reaching them with their letters. Luckily, however, the miner is not much addicted to epistolary correspondence, and what he does find it necessary to indite he manages to get conveyed to the coast somehow or other. If you have anything like an extensive acquaintance in one of these gold-digging regions, you need not be astonished some autumn day to find your door in Victoria opened in a free-and-easy way, and a knee-booted, grey-shirted individual walk into the nearest apartment. Then, as he begins to search his pockets for something, he introduces himself: "Name of Brown, Mister? Guessed so. Mine's Job. 'Job,' sez he to me. 'Job, I cale'late I'll put off a line to Mister Brown down to Victory,' sez he to me. 'Easy know him,' sez he. 'Ain't much to look at,' sez he, "but—

of I ain't lost it!" With this the honest miner stands open-mouthed, until, finally, a brilliant idea strikes him, and, with a self-satisfied slap, he throws down on the table a greasy document, which he produces from the lining of his felt hat, and which you find has been about five months on the way, while the amateur postman has been "prospecting" in and about the Rocky Mountains enough to merit great things at the publisher's hands if only he could write as fluently and as well as he talks.

And so, by drops and by dribblets, "mail matter" trickles in to moisten our letter-thirsty souls in the Far West, until—too quick for the man whose bill is then due, too slow for everybody else—the days roll along, and with a hurry and a scurry, a running hither and thither, mail day again comes round.

This was written some years ago. Railways have made many changes since then, and to the places in the vicinity of the iron road it is no longer applicable. But in nearly all of the more out-of-the-way parts of the country mail day will always bear much the same character as that which I have attempted to describe.

THE LANGUAGE OF THE PACIFIC SLOPE.

The reader need expect no philology in this section. He will hear nothing of the twenty or thirty languages or dialects spoken by the Indian tribes of the great region under description, nor one word of any of the several yet unknown and unrecorded languages existing, though soon to become extinct, among the aborigines. English is now the language universally spoken by all civilised men north of Mexico. Spanish is still spoken in Southern California, but only among the descendants of the Mexican inhabitants, though they all understand English. The French-Canadian voyageurs and their mongrel families still speak French, but they also understand English. And all those who have much, or anything whatever, for that matter, to do with the native tribes, understand the Chinook jargon, a kind of *lingua franca*, composed of fragments of many tongues, aboriginal and European, though based upon the language of the Indian tribe, called the Chinooks, who at one time dwelt at the mouth of the Columbia River, but of whom only fragments now exist on the Siletz Reservation, near the Oregon Coast. Spanish words have, however, got intermixed with the English spoken by the whites, while native Indian words are also frequent.

But what distinguishes the vernacular English of the Pacific from even that of the West generally is the number of "slang" words that corrupt the "well of English undefiled." "Ameriean"—as the Transatlantic Secretary of Embassy styled the tongue of Shakespeare and Milton as spoken by the Emperor of Russia—is rich in these unrecognised fragments of English. But the *argot* of the Pacific slope is to a great extent peculiar to itself, though every year less so, and smacks so much of the soil that, before understanding it, the student must learn much of the Pacific Coast, its people, its industries, and conditions of life. It may be, therefore, useful to devote a few paragraphs to this by-path of philology.

First, then, in a country where everybody works, it is natural that the idler should be contemptuously spoken of, though good-naturedly tolerated. In California the habitual

COACH FOR VIRGINIA CITY FROM RENO (NEVADA) STATION, CENTRAL PACIFIC RAILROAD.

idler is called a "bummer." He is always well dressed, affable in conversation, and ready to "take a drink" with any one. He peculiarly affects a cut velvet waistcoat of gorgeous hue, "California diamonds" in his shirt-breast, a polished quartz seal hanging at his fob, possibly a gold buckle to his broad watch ribbon, and has an infinite acquaintance, whom he insists on introducing to you, which introduction generally results in their being asked to "take a drink." I have noticed that they always have an "interest in a quartz lead," and are "down at the Bay" to get up a company to work it. A "loafer" is not so bad as a "bummer," for though a loafer may become a nuisance by calling at unreasonable hours at places of business, yet this does not stamp him as endowed with this permanent quality of character, but only as being seized with temporary idleness. A "bummer," on the contrary, is a low, disreputable, lazy fellow, very equivalent to the familiar "sponge." The term is probably, according to Mr. Hittel, derived from the vulgar German words *bummeln* and *bummeler*, which are about equivalent to "loafer" and "loaf." Its origin has been attributed to *Buehmen*, the German name of Bohemia, a nation proverbial for the number of its sharpers and adventurers. In France the gipsies are called *Bohémiens*, because of their roving and worthless character. If there is anything worse than a "bummer" it is a "whisky bummer," a term I have heard more than once applied to the Pacific Coast reputation of some gentlemen who in after years, and in a more severe atmosphere, became famous statesmen and distinguished generals.

"On it," is a peculiar and expressive Pacific phrase. Endless tales hinge on the use of this phrase, and it is remarkable how, with the almost inexhaustible resources of Californian anecdote to draw on, you will hear the same wretched story related over and over again, until the initiatory syllable of it being a precursory sign of what is about to be inflicted, puts the wearied traveller on his guard against the coming boredom. Men travel so much about on the Pacific slope that they soon acquire all the stock stories, and, of course, it is those that are most frequently repeated, and the most stupid of them, that seize the shallow sense of humour in the dull men, who are found even in these countries of sharp wits. A man who is "on it" is generally looked upon as a "sealy customer;" and I regret, for the honour of the legal profession, that an indignant litigant frequently finds it necessary to apply this term to his attorney.

A man may be "on the make" when he is keen after filthy lucre; "on the fight" when he is combatively inclined; "on the shoot" when ready to "back his opinion" with his revolver; "on the splodge" when—under the influence, more or less, of alcoholic excitement—driving furiously about town in a buggy, halting at every other "saloon," "standing" champagne "to the boys," smashing a mirror or two, and paying for them out of a leather bag of twenty-dollar pieces, or "slugs," "cleaning out the town" with his pistol, and generally "spending his money like a man"—or a donkey—if one could imagine so sagacious an animal acting in such a foolish way.

The occupation of the gold-digger has suggested to him numerous expressions to signify his desire for his friends to partake of vinous hospitality with him. He prays them "to put in a blast," and they in their turn, as they lift up their glasses, are civil enough to say to their host, "Here's to you, old man, and hopin' your pay dirt'll

pan* out gay;" in other words, that the soil on which he is working may yield rich supplies of gold-dust and nuggets. At other times, the same hospitable request to partake of stimulants is indicated by the rather more generally-used expression of "take a smile," or the inviter is asked to "nominate his pisin," or, as somebody takes your arm at the corner of the main and the only street of Diggerville, you are requested in a cheerful tone of voice to "hist in a drop of pisin;" the two latter phrases being intended to express the popular opinion regarding the quality of the whisky, also vulgarly known as "chain-lightning," "mountain howitzer," "tangle teg," and "tarantula juice."

Spanish expressions naturally supply a large quatum of Pacific Coast, and especially Californian, phrases, which have, however, now got so perfectly incorporated into everyday language that they can hardly be classed as either slang or vulgarisms. For instance, the enclosure, or "corral," in which mules, horses, and cattle are confined, has supplied a verb and noun in common use. When a man is "cornered" in giving utterance to some untenable proposition, he is said to be "corraled;" when a horse-thief is caught he is "corraled," generally preparatory to his being hanged; and a successful operator on the Stock Exchange will be described as having "corraled" all the shares in the Root-Hog-and-Die Quartz Mining Company. A farm is universally called a "ranch," derived from the Spanish "rancho," and a farmer a "rancher," from the Spanish "ranchero." An Indian village is also called a "ranch," from the Spanish word "rancharia," and when, as is the custom in the more out-of-the-way places, and was universally so in more primitive times, a young man lives in a "shanty" or cabin by himself, he is said to be "ranching it." When the writer first wintered in Victoria he was asked by a most accomplished lady if he "roomed at a hotel, or ranched it?" There are also numerous other Spanish words in common use—such as "aparejo," a Mexican pack-saddle; "adobe," a sun-dried brick; "arroyo," a brook, or the dry bed of a rivulet; "cañada," a deep ravine; "alforja," a bag, usually made of raw cow-hide, used for holding the articles to be carried by a pack-horse, &c. A muleteer who carries goods to the mines or elsewhere is always called a "packer;" and to "pack" anything means to carry it, whether on the speaker's own back or on a quadruped's it does not matter. "Cañon," we shall see by-and-by, is a deep ravine worn by a river. To "cayote" is to dig a hole in a bank in search of gold, or to burrow like a cayote wolf. A late eminent Californian senator was familiarly known as "Cayote Joe," from his addiction to this method of mining before he betook himself to Washington. "Reata" is a raw-hide rope used for lassoing. "Rubric" has nothing whatever to do with matters ecclesiastical, but is merely the flourish with which Mexicans and native Californians end their signatures. The rubric is even a legal form of signature, and was the only way in which Francisco Pizarro could sign any document. To "rubricate" is to sign with a rubric, &c.† Numerous Indian words have also become incorporated

* A pan is a metal dish in which the digger washes out a test quantity of earth or gravel, and then judges his "claim" or mine by the result. In America a "claim" is said to be worth so many "cents" to the pan, just as in Australia it is talked of as yielding so many "pennyweights to the bucket." The pan is shaped like a wash-hand basin, and is used to knead bread in, or to wash the owner when he indulges in that luxury.

† Hittell's "California," page 385.

in the British possessions, where the natives are much more numerous than the whites, and on more friendly terms with the latter than in the United States. In some parts of the country, beside numerous Indian names, still retained for localities, many words in daily use are derived from some of the native dialects. A man talks of having no "chiekamen," or money, on his person, and will indignantly denounce the assumptions of the "tyhees," or great men, and even coins a noun, "tyheecism," to denote this arrogance of the tyhees. The lumbermen, who live close to the Indian villages, and see few other people except the natives, use these words to such an extent that to a stranger their conversation is almost unintelligible. The frontier-men and frontier-women too, also use in their language Indian words, in most cases derived from the Chinook jargon. For instance, I have been asked, when approaching a border farmhouse, whether, "when *clattowaying* (going) along thar," I had "*nannitched* (seen) a *clayl* (black) cow?" for the questioner's "*tumtum*" (heart, temper) was "*cultus silex*" (indifferently well pleased) at the "*hyon*" (plenty) trouble the beast was giving him.*

We should tire our reader's patience out, did we go over the various expressions used in the gold-digger's every-day life; how he takes a "square meal" when he comes to his inn, or how, when he gets into narrow circumstances, he is "dead broke," or "caves in," or "goes up a flume." He will promptly tell a bore to "dry up," a very expressive phrase, when one remembers how the Californian streams dry up during the summer. To show the application of some of these odd expressions, perhaps we cannot do better than to parody in miner English a portion of a proclamation of the Governor of British Columbia, anent some mining regulations, which lies before us. It may add some interest to this *jeu d'esprit* if the reader be told that it is based on a similar one, the authorship of which is usually credited to a late prime minister of the province, and an eminent law officer of the Crown! With this we may conclude our brief survey of the wide and fresh field of Western slang.

PROCLAMATION! HAVING THE FORCE OF LAW, YOU BET!

Whereas, a change in the mining laws is expedient. Be it enacted as follows:—
1. That all former proclamations are hereby repealed and "played out." Interpretation clause.—In the construction of this act the word "gub" shall mean the governor of this colony, and "commish" shall mean the gold commissioner for the time being. The words "fizzled," "played out," "pettered," "caved," and "gone up a flume," shall respectively mean, when applied to a mining claim, that the same is worthless; and when applied to an individual, that he is ruined, helpless, dead, or in debt, and the terms "dead broke" and "busted" shall, for the purposes of this act, be construed to mean the same thing. That the words "pile," "the dust," "the colour," and "bottom dollars," shall be construed to mean the current coin of this realm. The term "free-miner" shall mean every person entitled to mine. The term "on it" shall imply a willingness to buy, sell, or

* For a vocabulary of this rude linguistic medium of communication between the whites and the Indians see Smithsonian Institution's "Miscellaneous Collections," 1863 (No. 161), and "Dictionary of the Chinook Jargon" (McCormick, Portland, Oregon, 1865).

SUMMER ENCAMPMENT IN A NORTH PACIFIC FOREST: COPPER MOUNTAIN, NEAR ALBERNI, ON THE WESTERN SHORES OF VANCOUVER ISLAND. (From an Original Photograph.)

get drunk; and "on the make" shall mean a determination to make money, honestly, if you can; if you can't—make money; "on the sell" shall mean a willingness to sell, and "on the buy" a willingness to purchase. The term "you bet" shall be used to remove any doubt which may possibly exist in the mind of the individual addressed; and "you bet your life" shall be applied in the same way, but shall be more conclusive; and the term "you bet your boots" shall be equivalent to "you bet your life;" and the term "you bet your bottom dollar" shall, for the purposes of this act, mean "your life," or "your boots." The word "chain-lightning" shall mean very ardent spirits; and "mountain howitzer" shall mean liquor that kills at over one thousand yards; and "scorpion juice" and "tarantula-juice" shall be construed to mean "mountain howitzer," or "chain-lightning;" and "drinks for the crowd" shall mean any and all of the foregoing, for the persons present, but not any others. That "in a horn" shall be equivalent to the old classical term of "over the left;" and, for the purposes of this act, "in a horn" shall be equivalent to "in a hog's eye." These terms imply doubt, and shall be equivalent to "no you don't." That the term "vamoose the ranch" shall mean that the individual referred to has left for parts unknown; and "slope" shall be equivalent to "vamoose the ranch;" and "make tracks" shall, for the purposes of this act, be equally as expressive as the two foregoing terms. That the term "got the dead wood on him" shall not refer to any kind of timber whatever, dead or alive, but shall be used when one individual has obtained a fair or unfair advantage over another; and the term "got the bulge on him" shall be as strong as "getting the dead wood on him," and getting either the "bulge" or "dead wood on him," may result from "sloping," "making tracks," or "vamoosing the ranch." That "spotted," when applied to an individual, shall have no reference to the state of the skin of any white man; or any spot thereon, but shall mean that he is watched; and, when applied to mining, shall mean that the gold is scattered; and the term "biz" shall mean business. That "soek it to him" shall be equivalent to the old word "punish;" and "give him fits" shall be equivalent to "soek it to him;" provided also, that the word "fits" shall not include apoplexy or epilepsy. That "jawbone" shall mean credit, provided also that the size, shape, and contour of such "jawbone" shall not, for the purposes of this act, be material. That "nare a colour" shall be equivalent to "dead broke," and there shall be no difference between "nare a colour" and "nare a red." That the phrase "there's a heap of trouble on the old man's mind" shall mean that the individual referred to is either "gone up a flume," "pettered," or that he has "struck the bed-rock pitching" the wrong way; and a "young man" shall, for the purposes of this act, be an "old man," and the feminine gender shall be included in the masculine, and both in the neuter. That "bully for you," or "bully for him," shall mean a term of approval; and "good on your head," or "good on his head," shall mean the same thing. That the terms "old hoss," "doc," "judge," "col'nel," "cap," and "old boss," are all equivalent, and the term "or any other man," shall have no definite meaning, and may be applied indiscriminately "all the time." And "slum-gullion" shall mean clay; "pay dirt," dirt containing gold; and "good prospects" shall not mean a pleasing landscape, but plenty of "pay dirt;" and "wash-boulders," "wash-gravel," and "bed-rock pitching," shall mean indications of gold somewhere. That

a "jumper" shall not mean a person who indulges in the active exercise of jumping, but shall mean a person who possesses himself of another man's claim because it is paying; and an invalid, or cripple, or woman, may be a "jumper." 2. It shall be lawful for the Guv, you bet, to appoint one or more commishes, as he may think proper, to transact the biz of the mines of this colony. 3. That no jumper shall hereafter be allowed to indulge in that exercise, and if the commish shall find him on it, he shall have power to sock it to him, or fine him drinks for the crowd, you bet your life. 4. That all honest miners, who are on the buy, may purchase more than two claims from those who are on the sell, provided also that both parties may or may not be on the make. 5. That any honest miner who shall, after the passing of this act, allow any other miner to get the dead wood on him, shall, you bet your boots, upon complaint made to the commish that there's a heap of trouble on the old man's mind, be spotted a muggins, and be ordered in consequence to pay a fine of two onnees, or, in default of payment, catch fits, and the commish shall approve of the conduct of the one that's on it, by saying "bully for you," and may add at his pleasure, "or any other man." 6. Not finished, and therefore this act is to save time. Issued under our seal of Cariboo, this ninth day of May, and the tenth year of the mines. By the Guv's command, N. Y. Z., Boss of the Colonial office. God save the Queen, and good on her head!—and don't you forget it.*

New phrases are always coming into use. For instance, of late years a California "wastrel" has been called a "hoodlum," a new-comer a "tender foot," a party an "outfit," and so forth.

"PUTTING THROUGH THE WINTER."

Perhaps I cannot better conclude this chapter, and these sketches of Pacific coast-men and life, than by saying a little about wintering on the shores on the North Pacific, or "putting through the winter," to use the familiar phrase.

When winter catches the traveller in Victoria, Vancouver Island—tho western suburbs of which we have engraved on page 20—or anywhere thereabout, he must look out for dreary rain or sleet driving along the streets of the little town. This is the time for mud ankle deep on every road. It is a season when no man travels very far afield. Then all exploration is stopped, and every one endeavours as best he may to "put through the winter" in the manner most agreeable or suitable to his inclinations. Victoria is the general rendezvous, and now in November the streets are crowded with stalwart sunburnt fellows, attired in all the glory of new and very ill-fitting ready-made clothes, "loafing" around the corners of taverns and billiard saloons. A few years ago we—that is, the writer and some companions—were likewise forced to "put through the winter" in the same place. We took a small house, and fitted it up in a rough way, as is the custom among bachelors there. For our food we bargained with a French restaurant at so much a month. Our "cord wood" we got in; and, our books and household gods around us, with a small Indian boy to act as henchman, we were prepared for a siege of rain and snow. The small Indian was no less an individual than a prince

* *All the Year Round* (1871).

of the blood royal—a son of old “King Freezy,” the drunken Indian chief of the Tsongeisth on the other side of the harbour. Victoria is wet and drizzly, and far from pleasant in the winter; but away in the Rocky Mountains country, in the northern forest-clad regions which slope down to the Pacific, winter means something even more stern and dismal. Snow covers the whole tract for a great portion of the winter months, and to the genial and more than Italian summer succeeds a cold almost Arctic in its intensity. Few men are abroad at this season, unless necessity compel them. The Indian keeps within his lodge, the trader and the hunter within the pickets of their forts, unless the latter come out to look at his traps, set at no great distance; and the gold-miner in Cariboo or Idaho fortifies himself to “put through the winter” as best he may. The ground is too hard to work profitably, and for five or six months these lie on their oars, until the spring sun melts away the winter blanket of snow. Up in these parts, by the time October’s first snows are whitening the tops of the mountains, and the ice is beginning to form in the “prospect hole,” at which they wash themselves of a morning, hundreds of sturdy honest fellows are very seriously cogitating about “putting through the winter.” If they are in funds, or if they have little money, they “come down below,” and at this season you may meet them by hundreds, trudging or riding over the mountain trails that lead down to the milder, wetter regions of the coast. If you ask the traveller whither he is bound, he will tell you to “put through the winter.” If his “claim” has yielded well, he will pass the next few months in Victoria or San Francisco in state, generally spending all that he has toilsomely earned through the past summer. He exchanges his old indiarubber boots, his grey and not over clean woollen shirt and ragged trousers, for the spruce attire most affected by the “honest miner,” as he delights to call himself, and lavishes his money in a way so foolish that only the honest miner would ever think of it. For him the gambler sets his snares, in the shape of “small games” of monte, “seven up,” and “cut-throat poker;” and the “saloon keeper” and all his satellites spread their nets to catch this reckless, foolish bird. If he be poor, he will take a little board “shanty,” in partnership with some other “mates” in the same predicament, and will, probably, take unto himself some aboriginal damsel whose attractions have captivated him, and idling about the street corners, disporting himself at the squaw dance house, and possibly in indulging in a “little game” also, he will pass the winter. If he be wholly penniless he still manages to get through. The vicissitudes of fortune are too common in a new mining country for anybody to be surprised at a man being, in Pacific parlance, “strapped,” or “flat broke;” he may be poor to-day and rich to-morrow, and is treated accordingly. If he be known he has generally no very great difficulty in getting some restaurant keeper to trust him with a winter’s board; a “dry goods man” to rig him out in a suit of clothes; and he is a friendless or unbefriended man indeed who cannot get somebody to lend him enough of coin to pay for his occasional morning “cocktail,” or other little expenses which the honest miner looks upon as quite indispensable to his existence. It is really surprising with what coolness a man who has not a penny in the world will what he calls “run his face” for a winter’s board, and how leniently the hotel keeper looks upon this little weakness of his. I fancy few in this country would care to trust anybody to the extent of £50, £60, or even £100, for a hotel bill; and yet that is done every winter

to these miners on the other side of the Rocky Mountains. It is rarely that a miner, even if he be unknown, is refused a meal at a roadside house on the way to the mines.

THE SNOQUALAMI FALLS, WASHINGTON TERRITORY. (From an Original Sketch.)*

He looks upon it not as a favour, but as a right. I fully believe that the old miner thinks that he is entitled to a suit of clothes on credit for the asking anywhere; he has spent money in the country, he argues, and deserves something from it. Yet it is astonishing how seldom these tradesmen, who require to be so full of faith, lose by their customer. He may possibly not see him for years, but he generally pays him in the end

* See Vol. I., p. 307

If the miner be wholly friendless, creditless, and moneyless, he may work a little during the winter. He will saw wood, hunt for the game-shop and the butcher, through the wet winter, or do something or other; but still, that is about the last of his thoughts. This class of men seem to look upon it as a settled matter that they shall earn in the summer enough to pass the winter in some town jovially, and, whether rich or poor, are rarely depressed in spirit—a better time is coming.

"We're putting through the winter," an old acquaintance (a Government official) writes me from "Carson City"—a little town not far from the Sierra Nevada Mountains much afflicted with such gentlemen—"just in the old style. We ain't got a cent—there *isn't* a cent in the treasury; if there *was* we couldn't draw; but I've got a good room, a dog that can sponge for itself, and *the boarding-house men hold out astonishingly!*" My correspondent is the type of a class—happy under the circumstances. I fancy if anybody in London attempted such systematic credit, he would be very apt to be looked upon as a suspicious character, and to be committed to the charge of X 0124, as an individual worthy of the notice of the nearest police magistrate. Happy is it, therefore, for the band of stalwart fellows who are pioneering in the West, and sometimes get beggared in the attempt, that North-West America is not England. But, in whatever way the gold-digger "puts through the winter," he is only too restless to be off again, and has generally considerable difficulty to keep intact enough of coin to form what he calls, in the gambling language only too familiar to him, "a stake," to pay his expenses "up," and enable him again to set to work at his claim by the time the Gold Commissioner declares it "jumpable."

About April the exodus commences from Victoria in the shape of an advance guard of the "hardest up" of the lot; and from that time until June you may daily meet long troops of them trudging through the snow, sleet, and mud, with a rusty frying-pan, a tin pot, and a pair of red, blue, or green blankets, containing their "possibles," on their backs, very dull and very tired, for a British Columbian road is a "mighty hard" one to travel. A joyful meeting at the end of their journey ensues with their old comrades, who have wintered on the creek (too poor, or too disinclined to come down); news is exchanged, parties made up to "prospect" for new diggings, and before another winter is come, and the snow on the Bald Mountain warns them to be getting under shelter, doughty deeds are done by brave men, who, though they never heard of any Geographical Society, are yet for all that as great explorers as some at whose diluted narratives the ladies clap their hands in Burlington House. Strange tales of wonder do they tell that winter, as they sit round the warm stove or blazing log-fire in their cabins, of their summer's deeds—stories which would make the fortune of some small travellers who seek to "make a point" in their books: how they have come, by the banks of some nameless stream, on some poor fellow's skeleton, with his empty provision-bag by his side, or a tin pot, on which is rudely inscribed that he was dying of starvation; or a bullet through that fleshless skull tells how this weary wanderer met his end. It is then that we learn that there are other methods of passing the winter than the reckless devil-may-care way we witnessed on the coast. Happy is he who lives to tell the tale. I have before me a letter written a few years ago, and in it the writer relates how he passed the winter in a

log-cabin in the Rocky Mountains:—"I started, as you know, for Idaho; but, when I got to the Columbia River, I saw people from the Blackfoot country, and they gave me such glowing accounts of it that I concluded I would put out for the favoured spot. I fell in with a party of men of my own sort, and three of us bought ponies from the Indians, and loaded them with provisions and camp kit, and started out with high hope of fortune, as I, at least, had done twenty times before. I have seen the rough sides of backwoods life, and have endured many hardships, but this trip was like a dark night to a small nigger! We were forty-eight days on the trail from Walla Walla to this place. We walked every foot of the way, and it either rained or snowed every day and night. The half of the tramp was intensely cold, and the ears and fingers of my two comrades froze badly. I am living now in a cabin, built with timber, within four miles of the summit of the Rocky Mountains. The inside of it is not elegant, but it is warm, and that is the main thing. The snow is I don't know how many feet deep, and there is not the slightest chance of working at mining until April. It is very cold. This is called a pleasant day; but I am, nevertheless, sitting as snug by the fire as I can without burning, and the ink freezes in my pen. I have to keep the door partly open for light, and it feels as if the butt end of the North Pole was punching me in the back. Frozen hands and feet are common as flea-bites in California, and two of my neighbours have died from cold. My chum is off on snow-shoes to bring home from the trading-place a hand-sled load of provisions; but the snow is commencing to drive, and I am getting afraid for him. Provisions are to be got, but are not very cheap. For instance, flour is (cheap) 34 dollars (£7 1s. 8d.) per cwt.; beef, 22 cents (11d.) per lb., by the quarter; bacon, 75 cents per lb. (3s. 1½d.); sugar, 80 cents (3s. 4d.); syrup, 78 cents (3s. 3d.) per gallon; beans, 60 cents (2s. 6d.) per lb. I bought quite a stock of coffee, and I have traded it off for beef, which is more filling at the money. If I don't 'winter kill,' as some of my neighbours have done, I intend to do some tall wrestling in the coming spring and summer, and get out before another winter. One like this will do for me—you bet!"

Bad enough is it if he stays at home, but the man who passes his life in the Far West is apt to be of a restless turn of mind, and wearies of remaining in his cabin. At all events, woe betide the forlorn explorers who are caught in the mountains in these snows. Such a fate was Fremont's, in the Sierra Nevada of California; Marey's, in the Rocky Mountains, and "Mountaineer Perry's," who journeyed on snow-shoes over the Tête Jaune Cache Pass to Jasper's House, a solitary post of the Hudson's Bay Company.* The winter traveller in British Columbia may get snowed up, as were the Canadians who, in 1863, attempted to pass that way, and whose remains were found next summer on the upper waters of Fraser River shattered and torn, with marks which told that what Indians and wild beasts had failed to effect, the living, maddened by famine, had done to the dead: they had resorted to the last resource of men demented by hunger—cannibalism. The hunter may be caught in the snow, or the trapper shut up in his little camp, seeing daily his small

* This is the same individual who crossed "the plains" trundling his worldly effects before him in a wheelbarrow.

stock of provisions lessening and the storm still blowing without. Sad is the lot of such, but still sadder even is that awful tale which yet lingers in California—of the trains of emigrants who, on their way to California, were caught, with their wagons and cattle, in the snows of the Sierras in the winter of 1817. They built themselves little huts, and as long as their provisions held out they maintained hope. Soon the snow covered their cattle, and they knew not where to find them. They then lived on hides, though some refused to touch them. Little parties attempted to reach the settlements and bring necessities, but failed; and then scenes ensued which pen would fail to describe. There were women and children in that band; but women forgot their womanhood, and children's youth and mother's love were no protection to them. At last the terrible news reached the settlements, and help was brought them. It was too late for many, and those who were saved would, in their shame, have preferred death The log cabins which had been the scene of such revolting acts were razed to the ground, and all tangible traces of such a tragedy erased. Many years have now elapsed since this happened, but as late as 1865 I was pointed out a survivor who had taken part in it. It seemed to me, as I shuddered at the remembrance of the story, that his face yet bore a sullen aspect—a Cain-like mark by which all men might know him. The story related is one of the most terrible in the annals of California, and all the more horrible in that it is strictly true, and has been more than once almost paralleled. It nevertheless deserves to be recorded as an episode in the earlier life of the young state—as a horrible concomitant of the *auri sacra fames*.

About the southern end of Vancouver Island wintering is scarcely such dreary work as in the far-off wilds. The winters are usually very wet and "muggy;" but little snow falls, and even then it only lies for a few days. The cold is not severe, and most of the ice used so extensively during the summer months is brought from Harrison Lake, in British Columbia. The winters I passed there were very moist. Rain fell in an almost continual pour, so that none of the hundreds of idle men who were "putting through the winter" in Victoria could go very far afield. Still, now and then, tired of the prison-life of that little town, where every face was familiar, almost *ad nauseam*, we would wander out by the road nearly knee-deep in mud, or into the dripping woods, seeing what was to be seen, or away into the forest-paths or byways, where the "dead-broke miners" were felling trees, or heaping up cord-wood for the market. For this privilege in the vicinity of towns they generally pay a small royalty to the owners of the land. Here and there in other quiet places Chinese would be also working away at the same business. They would generally be in partnerships of half a dozen to a dozen, and long before we came in sight of them we could hear their noisy chattering resounding through the woods, or we would overtake their industrious compatriot, the Chinese pedlar, trotting along with two bamboo-woven covered hampers dangling at either end of a bamboo pole, suspended on one shoulder.

Most of the younger men among the gold-diggers would remain in town all winter hanging about the bar or billiard rooms, "ranching it" in "shanties" in twos and threes in a more or less decidedly bachelor life. But others of a sporting proclivity, or so scant of coin as to be impelled to leave town, would go in small parties and establish

the majority of his patrons. Perhaps still more amusing than the theatre was the town crier—a half-crazed fellow, though remarkably sharp-witted and clever in some things—"calling out" the theatre, first in English, then the "laughing-house" in Chiuook, for the benefit of a gaping crowd of Indians; and then in a flow of gibberish, which was supposed to pass muster for Chinese for the information of the sloping-eyed Mongol gentlemen, who, however, did not patronise it, much preferring to spend their spare dollars in opium or gambling instead.

Of the life of the settler or gold-digger, who has anticipated the threat of Cousin Amy's jilted suitor by taking to himself "some savage woman," I need not speak. To hint at this is almost more than sufficient, familiar though the practice is to all who have ever visited North-West America. Lilloett, in British Columbia, and Lytton, on the Thompson River, used to be favourite localities for men afflicted with the "squaw and buckskin mania," for which Captain Burton assures us there is *no cure*. The Hydahs and Tsimpscans are the coast favourites, while the Lilloett and Lytton Sultans throw their handkerchiefs chiefly at damsels belonging to the Shouswap and allied tribes. The amusements of the place are not high. "Melodeons," or music-halls, the "squaw-dance house," and cheap Jack auctions, with secret gambling-houses, though these are sharply looked after by the Government, supply the chief amusements of the miners. For those of higher tastes there was a good deal of informal hospitality. The police-court was a very amusing place to the student of human nature, as developed among the various nationalities found on the North Pacific Coast, and the local legislature, a burlesque on representative institutes, now merged into a somewhat more dignified assemblage, containing the collective wisdom of British Columbia and Vancouver Island, was a never-failing source of mirth. I speak of years before the Pacific railroads had revolutionised the West.

Those were free-and-easy times. You required little introduction in those days, except an honest face and a little common sense. Many pleasant evenings did we then pass in the hospitable houses of the old settlers, coming home by the moonlight over snow or through rain, careless of either, for we had a light conscience and a heavy coat. Many of those who shared in those now—seemingly—far-off days may wonder if those light-hearted times can ever come back, when we used to trudge, with the now dead and vanished men, ten miles on a dark night to pay a visit at some country house in the backwoods, where we used to keep an extra pair of boots. I have still an invitation from some friends in Washington Territory which I may copy for the amusement and instruction of the reader. It runs as follows:—"Come and stay as long as you've a mind to. We've lots of pork, lots of flour, apples, and cider, half a keg of whisky, and twelve sons and daughters all grown up, and all living at home. But if you think that's not enough company, bring over a couple of your friends—the more the merrier." No wonder that doleful letters now reach us from that once jolly region. The times are changed, and the people are changing with them. There is now no house where spare shoes are kept. The old settlers are dying off; the good old times are gone; and that the "country is going to dogs" is the conclusion of the North-Western Cassandras!

After the dreary winter an early spring around Victoria is very pleasant. The whole

country not covered with fir forest or oak groves is bright with flowers, among which the blue gamass lily (*Gamassia esculenta*) and the yellow bedstraw (*Galium*) are particularly conspicuous. Frogs—those harbingers of spring—croak in every marsh, and

UTE INDIAN CHIEF.

the whole vicinity of the town looks very enticing. Every morning during the springs I speak of long troops of miners were to be seen moving down Bastion and other streets leading to the Fraser River steamer, lying at the Hudson's Bay wharf, pack of blankets on back and tin kettle in hand, accompanied by two or three friends and their boarding-house keeper, and, with a general advice to "take care

of themselves," moved off with cheers. I have seen the then attorney-general of the colony in a similar "rig" on his way to the gold mines. In another six weeks or two months the town was deserted, and people had settled down to their usual quiet jog-trot mode of existence—the picnicing and beating up "the Gorge" by the log

WARRIOR OF THE SERPENT INDIANS (UTE TRIBE).

bridge (p. 17), and making that show of business, which was the normal life of the Victorians in summer, before the iron roads brought prosperity and weariness of the flesh.

With these remarks, we shall conclude this sketch of men and manners in a region destined yet for great things, and the motto of which might well be the hopeful one of Washington Territory: "Alki, alki"—"By-and-by!"

CHAPTER II.

THE UNITED STATES: THE ROCKY MOUNTAIN STATES AND TERRITORIES: NEW MEXICO;
ARIZONA.

THE Rocky Mountain States and Territories, properly speaking, are Montana, Wyoming, Colorado, and, in a less degree, Arizona and New Mexico. It is, however, convenient to also include in this group Utah and Nevada; and, accordingly, under this heading, we may have a few words to say regarding the latter, and also of Dakota, which, perhaps, more rightly belongs to the Missouri-Mississippi Valley. For the sake, however, of not interrupting too abruptly the sketch of the physical features of the country, we shall follow the arrangement indicated. We shall, therefore, first take up New Mexico, then Arizona, which was once part of it politically, and is yet geographically. Then will follow brief sketches of Utah and Nevada. Montana may suitably come next, then Colorado, and last of all Dakota and Wyoming, which will introduce us to a knowledge of the Yellowstone Park and the Prairies, and so gradually lead to a consideration of the Missouri-Mississippi Valley proper.

NEW MEXICO.

New Mexico extends on its eastern boundary 345 miles, and on its western 390, while its average breadth at the 32nd parallel of latitude is 335. Its entire area is 122,460 square miles. It is divided into twelve counties, while the population in 1880 numbered 119,000 people, of whom 1,072 were "coloured" and Chinese, and 9,772 Indians. Santa Fé, the capital, had 6,635 at the same date, while most of the other towns could not boast of over 1,000. New Mexico is thus next to the district of Columbia, Utah, the Mormon stronghold, and Dakota, the most populous of all the United States Territories. Of the total population in 1880, 100,773 were native, 7,948 foreign born, while the males exceeded the females by less than 9,000. Of this number 14,139 were employed in agriculture, while mining and manufactures occupied 4,337. Many of the inhabitants are of Mexican descent, and speak the Spanish language.

The number of tribal Indians, according to the Report of the Commissioner of Indian Affairs, was, in 1883, 22,000, including the "tame" Pueblo people. The Apaches are probably the most troublesome. So much have these Ishmaelites harassed the borders that there used to be a disagreeable proverb prevalent in the territory when such-and-such a like youth was described as a smart boy.—"Yes," would be the reply, "he may turn out a spry youth, *if the Apaches don't nail him to a cactus!*" The exception to the generalisation is especially characteristic of the uncertainty of life on the frontier. The Pueblo Indians, on the other hand, are among the most civilised of all the American aborigines. Several times they have been decided by the Territorial Courts to be citizens of the United States, but they have always preferred to retain their tribal existence, each of the nineteen pueblos, or villages, having its own government. In all they number 9,500.* The Apaches and other savage tribes have now been tolerably well subdued.

* See also "Peoples of World," Vol. I., pp. 183—191.

Viewed from a physico-geographical point of view, the general surface of New Mexico consists of high level plateaux, traversed by mountain ranges, "between which are many broad fertile valleys, from which rise occasional peaks of great height." The Rocky Mountains, before entering the territory from Colorado, divide into two ranges, the western of which is called the Sierra Madre, east of which lie nearly two-thirds of the territory.* West of the Sierra are table-lands or *mesas*—often standing apart from each other, and resembling gigantic fortresses—detached ranges of mountains, many fertile valleys, and some extinct volcanoes. East of the Pecos River, and the Eastern range of the Rocky Mountains, the surface slopes gently towards the Mississippi River and the Gulf of Mexico, while the south-east part of the territory is occupied by part of the celebrated *Llano Estacado*, or Staked Plain, a steppe or plateau entirely destitute of wood, and except after the slight rainfalls which visit it of any other kind of vegetation. Through this treeless plain—the route across which is marked by stakes, hence the name—the Red River of the South branches into numerous forks all running into deep gorges. On the plain itself the eye rests on no land-mark or object of relief, while here, in common with similar plains when the ground gets heated by the vertical rays of the sun during the middle of the day, the mirage accompanies the incessant tremulous motion of the lower strata of the atmosphere. The very extraordinary refraction of the atmosphere upon these elevated plateaux causes objects in the distance to be distorted into the wildest and most fantastic forms, and often exaggerated many times their true size. "A raven, for instance," writes General Marey, in his official report to the United States War Department of his exploration of this region, "would present the appearance of a man walking erect, and an antelope often is mistaken for a horse or buffalo. In passing along over this thirsty and extended plain on a warm day, the eye of the stranger is suddenly gladdened by the appearance of a beautiful lake, with green and shady groves, directly upon the opposite bank. His heart beats with joy at the prospect of speedily luxuriating in the cool and delicious element before him, and he urges his horse forward, thinking it very strange that he does not reach the oasis.

"At one time he imagines that he has made a sensible diminution in the distance, and goes on with renewed vigour and cheerfulness; then, again, he fancies that the object recedes before him, and he becomes discouraged and disheartened. And thus he rides for miles and miles, and still he finds himself no nearer the goal than when he first saw it; when, perhaps, some sudden change in the atmosphere will dissipate the illusion, and disclose to him the fact that he had been following a mirage." The level of the "*Llano Estacado*" towers some 800 feet above the surrounding country—3,200 to 4,700 feet above the sea*—and is bordered by precipitous escarpments, "capped with a stratum of snow-white gypsum, which glistens in the sun's rays like burnished silver."

"Prairie Dog" towns often extend for miles through portions of this territory. This little marmot—for the reader need hardly be told that except in its popular name it has no relation to the dog—is known to zoologists as *Cynomys Ludovicianus*, to the

* "List of elevations principally in that portion of the United States west of the Mississippi River" ("Geological Survey of the Territories," Miscellaneous Publications, No. 1. 1875).

Indians as the *Wish-ton-wish*, and to the French Canadians as the *petit chien*. Its towns are the most familiar features of the dog prairies of the West. It has been

PRAIRIE DOG "TOWN."

said to be found in Oregon ; but this is, I believe, a mistake, the large gopher squirrels (*Spermophilus Douglasii* and *S. Beecheyi*) having been mistaken for it, unless, indeed, as has been suggested, it was exterminated by some epidemic such as that which some years ago broke out among the prairie hares in the vicinity of Walla Walla, on the

GLIMPSE OF THE SAWATCH RANGE, ROCKY MOUNTAINS.

Columbia River, resulting in nearly exterminating them. Often on the plains the traveller will pass through these "prairie dog" villages or holes for miles. At first the inhabitants are all on the look out on the top of the mounds in the vicinity, but at the slightest alarm they disappear into their "houses" with the alacrity of rabbits. Sentinels generally keep watch, and give the signal of danger approaching by a peculiar yelp, and immediately, after securing the safety of their village, disappearing. The burrowing owl (*Athene cunicularia*) often inhabits the same holes, and, as will be seen in the illustration given on p. 44, the rattlesnake is occasionally also a tenant with the mammal and the bird. I apprehend, however, that the co-operative housekeeping is entirely as unwilling a one on the prairie dog's part as is that of the bailiff with the impecunious Briton.

Santa Fé—7,014 feet above the sea*—in spite of its romantic associations derived from the narratives of the early adventurers in the West, is anything but a picturesque town. Its streets are narrow, its churches poor, and its houses, for the most part, painfully prosaic in their utter newness. Yet the latter are very comfortable, being all one-storeyed and often covering several acres of ground. The walls are of adobe, or sun-dried brick, either white-washed or bare, and are thus cool in summer, and sufficiently warm in winter. Protestantism does not burn brightly in Santa Fé, the one church for years being unable to obtain a roof through the contributions of the members of that faith in the city. Nearly all the inhabitants are Roman Catholics, and the town itself is the seat of a Romish bishop. Of course there is a plaza, or tree-shaded square, as there always must be in every town which owes its origin to the sleepy siesta-loving Spaniard. The names of the streets and other localities in New Mexico also bear the same impress, contrasting in their piously superstitious nomenclature—their "Santa Domingos," "Jesus Marias," "Spirito Sanctos," or "El Sangré De Christos"—with the "Buckskin Joe," "Strip-and-at-em-Mine," "Cash Creek," or "Hooked Man's Prairie" of the rougher but more manly Anglo-Saxons who have taken the place of the indolent Castilian race. Many of the traders are of German Jewish extraction, as they frequently are in the West, and in Spanish America. "Their stores," writes Dr. Bell, "are well filled with everything required by the emigrant, and a good deal of rubbish to meet the demand of the Indian population. A large trade is done in paste and brass jewellery, and a still larger one was formerly done in firearms, some specimens of which I examined with great curiosity. The wholesale price of the single-barrelled guns was two and a half dollars each, and they could not possibly go off without bursting. However, since the Navajos have been 'improved' off this country, the market for this kind of goods has ceased, and as Northern Mexico no longer produces the vast hoards of precious metals which formerly enriched its inhabitants, the Santa Fé trade has degenerated to local insignificance, and the great Santa Fé trader has now joined the other romantic characters of bygone days. No doubt he will again reappear on the scenes, but so changed that we shall scarcely recognise him. He will wear a frock coat, and a linen shirt; his goods will come by steam; and his stories will relate not to Indian fights, but to railway accidents."

Hot and mineral springs, salt lakes, or *salinas*, are common over this territory.

* Taos is 6,950 feet, El Moro 7,238, while Elizabeth Town is 8,200 feet above the sea.

supplying, indeed, a large proportion of the salt used in the neighbouring portions of Mexico and the territory itself. Anthracite is found, gold and silver are plentiful, and were even mined in the Spanish times, and copper is abundant; but Indian raids and the scarcity of labour have retarded the progress of all mining enterprise. The statistical returns show that about 1,950,000 dollars' worth of gold and silver are annually produced by such mines as are worked. Lead, iron, and other metals are also found, but their extent and value are as yet unknown. The climate varies much. North of Santa Fé the days are never sultry, and in the vicinity of that city the winters are even severe. In the south the climate is mild, but owing to the elevation of the country rarely sultry. The sky is clear, and the atmosphere so dry that meat may be preserved a long time without salt. As might be expected, pulmonary complaints are scarcely known, the number of deaths from chest diseases being smaller in New Mexico than in any other part of the Union, except Arizona. Indian corn, wheat, barley, oats, apples, peaches, melons, apricots, and grapes grow well, but agriculture is as yet in a rather primitive condition. The territory is, indeed, better adapted for grazing than culture, the valleys, foot-hills, and table-land supporting large flocks of sheep on the sweet buffalo grass (*Buchloe dactyloides*) and grama grass (*Bouteloua oligostachya*) with which they are covered. The total number of acres of "improved land" was, in 1880, 237,392, divided among 5,053 farms; but of these 1,633 contained less than ten acres, and only forty-three 1,000 or more acres. There are several railways in the territory, and more are projected. The country is ruled by a governor and secretary, appointed by the president for four years, and an auditor, treasurer, adjutant-general, and attorney-general chosen by the territorial legislature, which consists of a council of twelve, and a house of representatives of twenty-four members, elected by the people for two years; in fact, with a few trifling differences, what commonly prevails in other territories, while the same may be said of the judicial powers. In 1883 the total value of the real, *i.e.*, taxable property of the territory was 27,137,903 dollars. New Mexico was one of the earliest parts of America visited by the Spaniards; indeed, it was entered by them almost a century before New England was settled by the Pilgrim Fathers. In 1848 it was ceded to the United States, and in 1863 Arizona was set apart from it as a Territory.*

ARIZONA: THE COLORADO AND ITS CAÑONS.

Arizona† is a corruption of the old Aztec name *Arizuma*, which was the name the Spaniards gave to that portion of Sonora which it comprises. It probably means a rocky country, from *ari* (rock), and *suma* (country). It contains 72,906,240 acres of land, and is divided into ten counties. The first account given to the European world of this part of the American continent was in the romantic story of Friar Marco de Niza, who, as early as the year 1535, made an expedition among the Indians of this region.

* Brevoort: "New Mexico, her Natural Resources and Attractions" (Santa Fé, 1874): Hawes *lib. cit.* Article "New Mexico," &c. The estimated population of the territory for 1884 was 150,000.

† For some of the information which follows I am indebted to notes drawn up by the Hon Charles D. Posten, formerly Superintendent of Indian Affairs, and Delegate to Congress for the Territory; see also Cozzens, "The Marvellous Country."

He reported a semi-civilised people living in stone houses, dressing in clothes of their own manufacture, tending flocks and herds, cultivating the soil, and practising the arts of peace—then a more singular occupation in the New World than nowadays. This account led to the celebrated expedition of Coronado, which was organised and conducted under the patronage of the Viceroy of New Spain in 1540. The Indians described by the early explorers lived in the north-eastern part of the territory, about 6,000 feet above the sea-level, in seven towns, called by the Spaniards the “Seven Cities of Cibola” (or the Buffalo), but readers of the early Spanish narratives must be cautioned against accepting these pompous narratives too literally. The explorers were as fond of calling every stream a “river,” and every village a “city,” as are their successors in the possession of this portion of their once broad domain. The people described by Coronado were the Moquis Indians, whose villages situated in lat. $35^{\circ} 55'$, long. $110^{\circ} 42'$, W., now contain about 1,800 souls, and have excited more than ordinary interest, both on account of their civilised life, and from the theory that they were the descendants of that Welsh Prince Madoc, who is believed (by his countrymen) to have sailed to America in the year 1170.*

But in Arizona are the remains of a pre-historic race. Near the Pima villages are the *Cusuts Grandes*, or Great Houses of the Aztecs or “Toltecs,” or whoever inhabited this region thousands of years ago. They have left no history, but the relics of a civilisation which puzzles the antiquarian. To use Mr. Posten’s words, “The *débris* and remains of broken pottery would indicate that this city covered an area of about ten miles; but of all the houses which formed the city but one remains. It seems to have been a citadel or granary, as it is situated near the centre of the city. It was built of mud pressed into moulds and dried in the sun (adobes), and was composed of many small apartments, none of them very high. Five rows of joists may yet be counted, indicating five storeys; but from the fact that they are all burnt off to the wall this house seems to have been destroyed by fire. About twelve years ago I extracted one of the joists from the wall, and placed it in the Smithsonian Institution at Washington. It bears evidence of having been cut with a stone axe. The city which formerly existed here was furnished with water by a canal from the Gila River, which also irrigated a valley now desolate. The remains of the canal indicate a width of ten yards and a depth of four. As to the former inhabitants and their history all is left to conjecture. We know nothing of their origin, their manner of life, their politics or religion, of their loves or hates, of their mortality, or their immortality.

“The only monument of their existence left upon earth stands there, in the solitude of the desert, as mysterious, as silent, as unreadable as the Egyptian Sphinx. One hundred miles south of this monument of a perished race stands another monument of another civilisation. It is the mission church of San Xavier del Bac, erected by the Jesuits, A.D. 1608. In the dim mirage of the desert these architectural sentinels stand confronting each other. The first represents the shadowy past, the second the epoch of Christian civilisation. The latter would be an ornament to any city in Europe or America. The weary emigrant, who has made his perilous journey across the North

THE GREAT CAÑON OF THE COLORADO: RAFT PRECIPITATED OVER A CATARACT.

American Continent in search of the 'Land of Gold,' is surprised as he emerges from the forest to behold a specimen of Saracenic architecture, with dome and tower, and fancifully decorated façade. It appeared to me a magical creation as it stood in bold relief against the western sun; and marvel of architecture as it is, in this remote place, the impression is heightened when you enter the sanctuary, and hear the same vespers chanted which follow the setting sun from Rome around the world. In the archives of the Society of Jesus may be found an interesting account of the wanderings of Father Kino in this mysterious country. The Jesuits followed up their explorations by establishing missions among the natives, many of which remain to the present date in a somewhat dilapidated condition. The avarice and tyranny of the Spaniards, who were engaged in mining in the vicinity of the mission, exasperated the Indians to revolt, and in 1680 the Apaches commenced a war of extermination. The wily Jesuits charged their neophytes to preserve the sacred buildings, and assured the converts—with the sublime faith of their order—that as sure as the sun shone, water ran, and grain grew, they would one day return and resume their sacred duties. It was one of the strange episodes of life that during my service as Superintendent of Indian Affairs for Arizona it was my fortune to re-install the Fathers of the Society of Jesus in their ancient Mission of San Xavier del Bac. The Indians received them with firing of rockets, ringing bells, strewing flowers, and every demonstration of joy." *

The Colorado of the West is one of the greatest rivers of the Pacific slope. It was first explored by Fernando Alarcon about the middle of the sixteenth century, and it is now navigated by steamers 500 miles from its mouth, while many thriving villages are situated upon its banks. Before describing the most remarkable features of the river, viz., its cañons, it may be well to sketch briefly the general features of its basin, drawing mainly for the particulars on Dr. Bell's admirable observations. Compared with the Columbia the basin of the Colorado is rather smaller. Its area comprises about 230,000 miles, while that of the Columbia is only 200,000, or within 10,000 miles of the whole area of France. On the other hand, the basin of Mississippi is 1,400,000 miles, and that of the Rio Grande del Norte 210,000. The Bear Mountains, a northern extension of the Wahsatch Mountains, and their connecting link with the Rocky Mountains, form the division between the Columbia and the Colorado Basins. In another direction—the east—the Colorado Basin is separated from that of the Rio Grande and Mississippi by the Rocky Mountains. It thus appears that the Colorado Basin forms a large triangle, limited "on the east by the continental divide of the Rocky Mountains; on the south by the highlands about the Mexican boundary-line; and on the north-west by the Wahsatch Mountains." In the northern angle of this area run the waters of Green River (p. 56), while the western slopes of the "summit plateau" of the Rocky Mountains collect the sources of Grand River. These unite to form the Rio Colorado of the West. Further down it receives the Rio San Juan, then the Flax River, or Colorado Chiquito (Little Colorado), and, lastly, the Rio Gila, which drains all the southern half of Arizona, enters the main stream at Fort Yuma—a very warm locality—and sixty miles

* Dr. Bell has also given a very full account of these and other ruins in his "New Tracks," Vol. I., p. 190.

above its mouth. "The entire Colorado Basin consists of a series of table-lands, piled up one above the other, and covering the whole country. In elevation they vary from 4,000 to 7,000 feet, and reach, in some places, a height of 8,000 feet above the sea. They succeed each other in a series of steps, which generally present abrupt and wall-like edges, the more recent stratum occupying the highest portion of the plateau. Complete barrenness is the rule, fertility the rare exception; scarcely any vegetation, save the artemesian scrub [wormwood or sage brush], is to be met with between the 36th and 42nd parallels; the earth for the most part is bare and naked, showing the wear and tear of ages, the erosion of the primeval ocean, and the cracks and fissures of the more recent watercourses."

This area seems once to have been the bed of the ocean, when the American continent was smaller than now, and the material from which the table-lands were formed derived from the wearing away of the shores and islands by the dashing of its waves; or, to use Dr. Newberry's language, by the erosion of the "broad and rapid rivers, which flowed from the mountains, and through the fertile valleys of a primeval Atlantic." These thousands of feet of sediment in strata seem to have been gradually converted into dry land by the slow upheaval of the Plutonic rocks in which they were embedded, which were then the San Francisco Mountains. Mount Taylor and Bill Williams's Mountain, mark the scenes of volcanic eruptions which formed these extinct volcanoes, now standing more or less isolated, and all beautiful in the midst of the eroded "mesas," or table-lands, such as are figured in Vol. I., p. 288.

The Colorado and most of its tributaries flow through what are called cañons, a Spanish-American word, signifying a deep defile with high walls, through which many rivers in the dry region of this section of country run. The word is commonly used over the Pacific coast for any defile, but as we shall presently see, it is only applicable to cuttings such as that which the Colorado makes. They are formed by the action of running water on soil on which even periodical rains do not fall to any considerable extent. The streams wearing the soil must be constant; and the surface strata worn must be of a character which will easily yield to the current. After the water has got once into a groove, the constant attrition of the water and the sand, and gravel carried down by it, will wear even through the hardest granite, as in this region it has to the depth of 1,000 feet. Wherever there are cañons, the country is sterile and utterly worthless, for the deep cuttings drain it to the utmost; the river lying buried, as it were, in the bowels of the earth, "lie far beyond the reach of animal or vegetable life on the surface." Five hundred miles above the mouth of the Colorado ocean is the "grand cañon" of the river, which of late years has attained much celebrity. This cañon is 217 miles long; and the walls vary in height from 4,500 to 6,000 feet; or, in other words, the river winds like a white thread more than a mile below the surface of the surrounding country. At the greatest elevation, the width of the chasm is from four and a half to twelve miles. In 1867, this great cañon was, much against his own will, explored by James White, a native of Wisconsin. To escape from hostile Indians, he, with a companion, set himself afloat on a raft on this river, and after terrible dangers, during which the raft was many times all but broken up, and on one of which occasions—in shooting a cataract—his companion was thrown off and drowned (a scene sketched on p. 49), he reached Callville, at the Pacific end of the

cañon. Unable to land, and even could he have done so he would have found it impossible to have obtained food, he nearly perished of hunger, being six days without any nutriment, save a few green leaves. He had been six days on the raft since starting, and still the uneven current bore on the rude float. "He saw occasionally breaks in the walls, with here and there a lush. Too weak to shove his raft ashore, he floated past, and felt no pain, for the overwrought nerves refused to convey sensation. On the afternoon of this, the sixth day, he was roused by hearing the sound of human voices, and raising himself on one arm, he looked towards the shore, and saw men beckoning to him. A momentary strength came to his arms, and grasping the paddle, he urged the raft to the bank. On reaching it he found himself surrounded by a band of Yampais Indians, who for many years have lived on a low strip of alluvial land along the bottom of the cañon, the trail to which from the upper world is only known to themselves. One of the Indians made fast the raft, while another seized White roughly and dragged him up the bank. He could not remonstrate. His tongue refused to give a sound, so that he pointed to his mouth and made signs for food. The fiend that pulled him up the bank tore from his blistered shoulders the shreds that had once been a shirt, and was proceeding to take off his trousers, when, to the credit of the savages be it said, one of the Indians interfered, and pushed back his companions. He gave White some meat and roasted mesquit-beans to eat, which the famished man devoured; and, after a little rest, he made signs that he wanted to go to the nearest dwelling of the white men. The Indians told him that he could reach them in 'two suns' by his raft; so he stayed with them all night, and, with a revolver that remained fastened to the logs, he purchased some mesquit-beans and half a dog. Early the next morning he tottered to the bank, and again pushed into the current. The first day out he gave way to the yearnings for food, and, despite his resolution to the contrary, he ate up his entire stock of provisions, which did not by any means satisfy his cravings. Three long days of hope and dread passed slowly by, and still no signs of friends. Reason tottered, and White stretched himself on the raft: all his energies exhausted, life and death were to him alike. Late in the evening of the third day after leaving the Indians, and fourteen days from the time of starting on his perilous voyage, White again heard voices, accompanied by the rapid dash of oars. He understood the words, but could make no reply. He felt a strong arm thrown around him, and he was lifted into a boat, to see manly bearded faces looking on him with pity. The great objective point was reached at last—the battle for life was won—but with the price of unparalleled suffering. The people of this Mormon settlement had warm, generous hearts, and, like good Samaritans, lavishly bestowed every care on the unfortunate man so miraculously thrown into their midst from the bowels of the unknown cañon. His constitution, naturally strong, soon recovered its terrible shock, and he told his new-found friends his wonderful story, the first recital of which led them to doubt his sanity." When he was carried ashore, he was found to be literally flayed from exposure to drenching from water and the scorching rays of the sun. "His reason was almost gone, his form stooped, and his eyes were so hollow and dreary, that he looked like an old and imbecile man."*

* Bell: *l.c.* Vol. II., p. 215; "Powell: "Exploration of the Colorado" (1875); Dutton: "United States Geological Survey" (1880—81).

THE *CEREUS GIGANTEUS*, OR MONUMENTAL CACTUS

White's feat has been since then repeated by Major J. W. Powell, whose party passed through the cañon in 1871. The current in the great cañon equals in velocity a railway train running forty or fifty miles an hour. Mr. Posten rightly enough remarks that the ruins of London could be thrown into the chasm without filling it up. (Vol. I., p. 288, and Plate XIII.) The whole length of the Colorado, or Red River—so called from its red sands—is about 2,000 miles; but it is at present only navigated and indeed only navigable, to Callville, 612 miles from the mouth. At the mouth, the "bore," caused by the spring tides, makes a rise and fall of some thirty feet. The principal Indian tribes inhabiting its banks are the Cocopas, the Yumas, the Mojaves, the Chemihuevis, the Hualapais, and the Yupapais, or Yampais (already spoken of). The bottom lands of the Colorado—away from the cañon—are very rich, and well suited for the growth of sugar, cotton, rice, maize, melons, and vegetables; but owing to the small rainfall, irrigation is necessary before cultivation can be pursued to any great extent. In the Colorado desert, as the southern portion of California in the vicinity of the river is called, the Indians plant their maize several feet in the ground, knowing that at a less depth the soil would be soon parched, and the grain be unable to obtain sufficient moisture to germinate. In some parts of the Colorado desert the soil is composed of sand packed closely together, with a hard, smooth, shining surface, or piled into loose hills, which are constantly shifting. To sum up the physical appearance of Arizona in a few words—it is composed of vast plains, covered with grasses, and crossed from north to south by broken ranges of mountains, full of minerals. In the northern part of the territory, the San Francisco Mountains rise to the height of 12,052 feet, and with their white caps are visible for a radius of 100 miles. In the southern portion of the territory, the Santa Rita Mountains are the most conspicuous, being about 7,000 feet high.

Fort Bowie is situated six miles up the Apache Pass, and is a mere collection of adobe huts built on the summit of a hill, "which rises as a natural look-out station in the centre of the defile, and commands the roads both ways for two or three miles of its length." It is a pre-eminently lonely and dangerous place of residence, as the many wooden tombstones in the little graveyard, all marked "Killed by the Apaches," abundantly testify.

Arizona is rich in silver mines. Indeed, the Spaniards found near the boundary-line the largest mines of pure silver which have been ever discovered in the New World. Gold, lead, copper, and iron have been discovered in many localities. Rock salt is found in the mountains, while the lagoons, bordering the Gulf of California, furnish an inexhaustible supply of this necessary. The indigenous trees of New Mexico and Arizona—and in respect of their vegetation and animal life the two territories may be considered as one—are all of a more tropical aspect than the usual American forest growth to the west of the Rocky Mountains. The mesquit shrub (*Algarobia glandulosa*), allied to the acacias, which are also represented, and other sub-tropical shrubs, are common. The beans of the mesquit are imported into this country for feeding purposes, under the name of algorobo. The Indians make bread out of them, and also distil an intoxicating drink from them: a prolific mesquit tree will yield ten bushels of beans annually. A cactus (the *Cereus giganteus*, p. 53), is the most singular tree of the forest growth. Many

species of the order are found in this region, indeed, it is their favourite home; but this is the largest of them. It is peculiarly fond of volcanic soil, and seems to require scarcely any moisture. Its huge grooved columns can be seen thrusting themselves out from between the rocks to the height of forty feet, the secondary columns forming a circle of four or six upright arms around the parent trunk. Its peculiar appearance in the landscape has obtained for it the name of the monumental cactus. Its fruit ("pitahaya") is gathered by the Indians when ripe, and is expressed for the sake of juice, which is made into treacle, while the pulp is compressed into a cake, stored away for winter use. The river bottoms are lined with cotton-woods, while the dry watercourses are marked by *Cercidium floridum*, the "green-barked acacia;" the arborescent *Dalea spinosa*, distinguished by its silvery, leafless branches, and the valuable iron wood (*Olneya tesota*). The *Chilopsis linearis*, allied to the trumpet flower (*Catalpa*), is abundant, being known as the desert willow, on account of the Indians weaving its long, slender branches into baskets. In the country more particularly affected by the arborescent cacti, Dr. Parry, in his report on the botany of the region, notes tree Yucas, or Adam's needles, as forming a conspicuous feature in the landscape, while the true desert flora, such as the neat evergreen *Larrea*, with its myrtle-shaped leaves, together with a sort of thorny *mimosa*, dull-coloured *Obione*, or grease wood, and the prevalent artemesias, or sage brush, all serve to give a faded aspect to the vegetation. The mountains bear an abundant growth of live oak (*Quercus agrifolia* and *Q. Emoryi*), and firs and pines, such as *Pinus contorta* (the Piño real of the natives), *Abies Engelmanni*, and the Piñon, or nut pine (*Pinus edulis*), the seeds of which are eaten. Wild hemp, sunflowers, and poppies are everywhere common and marked flowers. The American aloe, or maguey plant, is abundant on the hill sides and mountains, and is an important natural product. To quote Mr. Posten's graphic description:—"The head is formed in leaves like the artichoke, and grows to the size of a cabbage, being protected by sharp, bayonet-like shoots, eight to ten feet high. These being cut away with long knives, the Indians and Mexicans gather the head and utilise it in various ways. If roasted, it makes excellent food, smelling like a roasted pumpkin, but more astringent. It may be boiled down to a syrup, and form a saccharine feast, but the highest delight of the natives is to manufacture this mountain luxury into an intoxicating drink called 'mescal.' This is done in a primitive way, by fermenting the mashed head of the maguey in a raw hide stretched on poles in the sun, and distilling the juice in a rude alembic. The extract has very much the appearance and flavour of Scotch whisky, and has consoled many a weary traveller in that region besides myself. The fibre is manufactured into ropes, mats, carpets, and saddle-blankets." Among other useful plants may be noted the indigenous potato, or "comote," found on the mountain sides in all its native coarseness. Even in the desert a food is produced from a parasite known as the sand food of Sonora, which resembles the sweet potato in shape and flavour, and the amole, or soap plant (*Chlorogalum pomeridianum*) is used by the natives as a substitute for soap, from California to Arizona. It is considered a great preservative of the hair, making it as glossy as if oiled. Moreover, it washes flannel without causing shrinkage; though, as this is a use the natives rarely put it to, the toilet application of the plant is more valuable. The

ordinary American fruits grow wild in the territory; but, owing to the absence of extensive forests, wild game is not abundant; nor do the rivers furnish many fish, or great variety of what are got. Buffalo does not extend so far west; but bear, deer, antelope, hares, wild turkey, the top-knot quail (Vol. I., p. 280), and the peculiar Mexican "Paysano, or road-runner" (*Geococcyx californianus*). It lives almost entirely on the ground, very rarely flies, and frequents the highways, along which it will run from any one approaching. Its speed is nearly equal to that of a common horse, and it often furnishes an exciting chase to the solitary rider. It is allied to the cuckoo, and like that bird lives among the bushes, though it disports itself in open places. It is

VIEW OF GREEN RIVER, A TRIBUTARY OF THE COLORADO, UTAH.

the subject of many anecdotes in reference to its power of killing snakes, which are about as apocryphal as "snake stories" usually are. It is said that, on perceiving the rattlesnake coiled up asleep basking in the sun, this bird will collect the cactus and hedge him around with a circle, out of which the reptile, unable to escape, and irritated by the continuous pricks he receives in attempting to do so, bites his own body, and generally dies from the effect of the venom. It is just possible that this, and a score of similar tales almost as extraordinary, may be true—though this is not probable. Among other animal annoyances of Arizona are various venomous snakes, the tarantula, or large spider, the bite of which is often dangerous, huge centipedes, scorpions, horned frogs, &c.

Arizona has progressed rapidly. In 1856 the first exploration of the territory was made by a company under the command of Mr. Posten. After a weary march of 1,500 miles through hostile Indian tribes, he established his head-quarters at Zubac,

VIEW OF THE VALLEY OF THE BUBBLING WATERS, UTAH.

on the Santa Cruz River, and in this far-away wilderness planted the seeds of civilisation. The nearest military post was 100 leagues, and a mail from Washington did not reach this remote outpost in less than sixty days. The territory is now in telegraphic communication with all the principal towns in America, and the world. Mail communication is everywhere quick and convenient, while daily and weekly newspapers are published in all the large towns. The capital is Tucson—a town south of the Gila—containing a population of more than 7,000 people. North of the Gila the chief town is Prescott, named after the historian of Mexico, which contains about 1,900 souls. Altogether the population of the territory may be estimated at 5,300 “coloured” and 32,000 whites; the latter chiefly engaged in farming, mining, and commercial pursuits. In its area of 114,000 square miles may be found almost any climate, and land capable of supporting millions of cattle on the natural grasses which cover the country. Taken as a whole, its inhabitants consider Arizona well entitled to the name they love to apply to it—“The Marvellous Country.” It may, perhaps, be as well to add that it contains 25,000 Indians.

CHAPTER III.

THE UNITED STATES: THE ROCKY MOUNTAIN STATES AND TERRITORIES: UTAH; NEVADA; MONTANA; COLORADO; DAKOTA.

GLANCING at a map of North America the reader will notice a district lying between the Wahsatch Mountains and the Sierra Nevadas extending northward beyond the 42nd parallel, and southward into Lower California, marked as the Great Basin. None of its rivers reach the sea; but nevertheless the name, as Dr. Bell, who has written an excellent account of it, from which we shall take some facts, points out, embodies a glaring topographical error. Like the Colorado Basin, it is triangular, the apex of the basin pointing to the south and south-west. From the level of tide-waters at the Gulf of California the ground rises to about 5,000 feet. This is also the general level of the whole basin in its broadest part, while north of the Humboldt River, where the drainage divides, this elevation is exceeded, and though there are many local depressions under 4,000 feet north of the 37th parallel, there are few places below this elevation. The general physical character of the basin is much the same, the country being traversed by low, volcanic mountain ranges, about 1,000 to 4,000 feet above the general level, extending generally north and south, but as a rule running parallel to whatever spur of the Rocky Mountains or Sierra Nevadas they happen to be nearest. They are usually perfectly bare of trees, or even shrubs, and the denuding action of rain is evidently washing them down, and filling up the valleys with the eroded *débris*. The whole country is extremely dry, and on this dryness most of its peculiar characteristics depend.

"Artemesian scrub (sage brush)* and grease wood (*Obione canescens*)," writes Dr. Bell, "alone spring from the dry, parched earth, except when some stream of unusual persistence supports a row of cotton-wood trees (*Populus angustifolia*), and a few acres of grass, along its edges. From the decomposition of volcanic rocks, the soil in its ingredients is very rich, and when irrigation can be supplied, yields most abundant crops. There are broad, level districts, however, called by the settlers 'alkali flats,' which are covered with salts, usually nitrate of soda, and are thereby rendered perfectly barren. These white glistening sheets on the dry, unsteady atmosphere of the desert, form the most tantalising mirage to which a thirsty traveller could be exposed. At certain seasons they are covered for a short time with a thin coating of water—the local drainage of the surrounding district—which is soon dissipated by the scorching sun. The plateaux of the basin region were undoubtedly the last portion of the Western continent raised from the sea, the last from which the Gulf of California retired. Even now subterranean fires are active, and the process of gradual upheaval may still be going on. Earthquakes are frequent; mud volcanoes are still to be found in places; huge cracks in the earth's surface have occurred within the memory of living man; craters recently active dot the whole district; and hot springs are so numerous that I have counted fifty-two jets of steam issuing from the ground like pillars of smoke in one valley alone. When the Great Basin came into existence, or rather emerged from the water, there were dry lands and mountains east, west, and north of it, shutting out from it the moisture of the Pacific Ocean, as well as any that might travel thither from the far-off Gulf of Mexico. The climate may be considered to have been then not unlike that of the present time, so that the rainfall was far less, even in the new-born 'Basin region,' than it was over the Colorado Basin in its primeval state, which was then washed by a broad Pacific Ocean. The effect of these climatic peculiarities was that a sufficient quantity of rain never fell upon the 'Basin region' to form a complete system of drainage from the highest lands down to the sea."

There is nothing in the physical construction of the Great Basin to have prevented a great river emptying itself either as an independent stream or as a tributary of the Colorado into the Gulf of California. The Great Basin is not really a basin without an outlet, but only a collection of numerous small basins, each with its feeding stream; but owing to the little rainfall and great evaporation, the lakes are rarely so full that they require to be emptied by a stream powerful enough to break through the barrier which all streams must first encounter, and thus by the union of their waters to form a complete drainage system. The lakes are accordingly usually salt, if they have no outlet, and are becoming saltier year by year. But when the lake has an outlet it is fresh, though the stream is generally soon lost in the desert by forming a shallow sheet of water or a "sink" which has no outlet. The Great Salt Lake is a type of the salt lakes without outlet; Utah Lake of those which are fresh, this sheet of water being emptied, as is usual with lakes in other localities, by a stream. Most of the other lakes are, however, not permanent, being only broad sheets of water after rain, and

* Dr. Bell calls it "sedge brush," but this is an error. It is a too familiar sight in America.

perfectly dry and barren during the greater part of the year. They also vary greatly in size and elevation. For example, Great Salt Lake is in Utah, 4,200 feet above the sea level; Sevier, in the same territory, 4,690; Lake Tahoe, in California, 6,700 feet; Bear Lake, Utah, 5,931; Walker's Lake, Nevada, about 3,810; Mono Lake, 6,454;

STREET IN SALT LAKE CITY, UTAH.

Pyramid Lake, 3,940; Humboldt River Basin (Lassen's Meadows), 4,200; Williamson's Lake, 2,388; Morongo Sink, 1,500; Mojave Lake, 1,000; and Perry Basin, 530 feet. On the other hand, Soda Lake Basin, a large saline flat a little north of the Mexican boundary-line, is about seventy feet below the sea level, and though nearly always dry, Hardy's Colorado, or the New River, flows through the desert towards it when the Great Colorado is flooded.

On these occasions it breaks over its banks about forty miles south of Fort Yuma, and sends the New River north-westward for a distance of 100 miles or more. It has, indeed, been proposed to cut a canal from the river to the low ground, so that the "desert"—

VIEW OF SALT LAKE CITY, UTAH (WESTERN SIDE, SHOWING THE TABERNACLE, ETC.)

which is said to be land of excellent quality—might be irrigated and cultivated. But as yet nothing has been done to effect this desirable improvement.

Death Valley, the sink of the Amargosa, is, however, the most extraordinary depression in the Great Basin. It is 175 feet below the sea level; and though an area of 30,000 square miles drains into it, it is an arid desert, and appears at one time to have been a deep lake, overflowing in a river reaching the sea, when (as it is clear must have been the case) the country was more humid than now.

The Great Salt Lake is the largest sheet of water in the Basin. It is from 56 to 74 miles long and 32 to 39 broad, and there are not wanting evidences to show that at one time it must have covered twice or thrice its present area. Of late years it had been steadily rising; and it has been suggested that this is owing to the increased rainfall caused by the country in the Salt Lake Valley having been irrigated by the Mormon settlers, and thus increasing the evaporating surface. West of it, on the borders of Nevada, lies the "American desert." The soil here consists of clay and sand impregnated with salts. When wet it has the consistence of mortar. During the driest season lightly-laden wagons may pass between Pilot Peak and Spring Valley, but whenever there has been any continuance of wet weather the desert is impassable. Moore's Lake, a small, but, perhaps, more than usually picturesque sheet of water in Utah, is sketched on Plate XII.

The Humboldt River, 500 miles long, is the largest river of the Basin. It empties itself into Humboldt Lake. Reese River flows through a narrow valley about 100 miles long, and the Truckee, Carson, Walker River, and other streams, all end in the desert lakes or sinks. In the vicinity of most of these streams are little settlements of agriculturists. But the mining capabilities of the Great Basin are its greatest attraction. The State of Nevada, and the Territory of Utah, are both comprised within it. The former is the area within which are situated the richest silver mines of the world, and this fact renders the region, of such exceedingly little interest otherwise, of much importance. The best of mines were situated in the Comstock Lode, at Virginia City, but highly remunerative mines, both of gold and silver-bearing quartz, are found scattered all over the territory. We have already referred to their yields. But as a specimen of what they produced during the "flush" period, we may mention that in 1867 the Savage Company paid in dividends a larger sum than is derived from all the metallie mines of England and Wales put together.* The Comstock is now getting exhausted and Virginia City decaying.

UTAH,

So called from the Utah, Yuta, or Ute Indians—for the spelling of an Indian name is very immaterial, as most usually under the best of circumstances it is only approximately correct—"the dwellers in the mountains" (p. 40)—is a territory containing 87,476 square miles, and a population numbering, in 1880, 143,963 (though now nearer 150,000), mostly members of the Church of the Latter Day Saints, or "Mormons." Its physical features we have already described. It possesses some good grazing land, but the vegetation is not luxurious, and timber, except pines and firs in the mountains, is scarce. The climate is, moreover, bleak and changeable—deep snows and intense cold in winter, scorching heat and no rain in summer.

* Bell's "New Tracks," Vol. I., p. lxx. (Introduction.)

accompanied with thunder-storms and clouds of dust, which, for the time being, overwhelm everything. The minor earthquakes so common in California, and in all the Pacific region, as far north as Alaska, however, rarely visit the Great Basin. The soil is barren, but when irrigated, produces good crops of wheat, oats, barley, maize, buckwheat, flax, hemp, and fruits. Some spots, indeed, are amazingly fertile, producing as much as from 60 to 100 bushels to the acre. The chief manufactures are farming implements, furniture, wagons, woollen goods, leather, steam-engines, machinery, and cutlery, which industries have attracted many English mechanics to the country. There are now several newspapers, schools, and all the other appurtenances of Western civilisation. The Pacific Railroad runs through the territory, and a branch line connecting Ogden with Salt Lake City, the capital, is visited daily by scores of "Gentiles," many of whom are settled in the country. The Salt Lake country will speedily lose most of those characteristics which socially have so long distinguished it. Indeed, any account of "the City of the Saints" and the adjoining region, written prior to the epoch of the Pacific Railroad, would be manifestly misleading. President Taylor is still the high priest of the hierarchy, but the "destroying angel," and other institutions of polygamy, are about as extinct as Bishop Lee, who in 1877 expiated his crimes as the representative of a state of affairs that can never again return. I do not consider it incumbent on me to inflict on the reader the thirty-times told tale of how Joe Smith, the founder of Mormonism, was killed in Nauvoo, and his followers, led by the succeeding "Prophet," fled to this then remote valley; how they suffered, how they fought, and how they prospered by dint of perseverance, self-denial, and rigid discipline. Neither—not being a German—will my literary conscience be disturbed if I omit all reference to the deep metaphysical principles which are supposed to underlie—but do not—the monstrous falsehood of which Latter Day Sainthood is the representative. The Mormons prospered because they lived in strict obedience to shrewd if unscrupulous leaders, owing to their fortune in being on the line of travel to the Pacific, and above all because they "hung well together." They had a hard task in contending against nature, but they conquered by dint of great industry, directed and stimulated by the knowledge that, as they had fled from civilisation in order to practice unmolested their peculiar tenets, if they did not make a home here they would either die, or, in seeking bread elsewhere, fall into the hands of the Philistines, from whose wrath they had for the time being escaped. They were more moral than similiar communities in the West; for, unlike most of these, their conduct is regulated by some ethical rule of life, even though the leading one practically is a social sin. Still, a bigamous Mormon is not like a bigamous Englishman. The one breaks no law of the community he lives under, though the law of the land; the other invariably does so, and, accordingly, the rest of the latter's conduct is usually in keeping with this uxorious weakness. I have, however, repeatedly heard those who know Salt Lake City much better than I know London deny that it is a moral place. True, drunkenness is unknown among the faithful; but conjugal fidelity is not more universal than it is in other polygamous countries. The women live in a state of degradation. Most of them are Welsh, Scotch, English, German, and Scandinavian, and are usually grossly ignorant, and (poor creatures!) homely-faced and dowdy-figured in the extreme. A Mormon usually speaks of his wives as *his women*, though too much ought not to be

made of this, because the same phrase is commonly applied to their own and to other men's lawful wives by the rougher of the Western settlers. The male Mormons are intensely greedy after money. Their creed is a purely utilitarian one. I never heard of an American who, in these latter times, at least, joined them from a conviction of the truth of their religious principles; and, considering that it must be a strange creed that will not find converts to it in the United States, the fact—and fact I believe it to be—speaks volumes against the Mormons. Their “converts” are usually Europeans; and even then, the material advantages held out to the land-loving Swede or Welshman have as much to do with the

HOTEL IN SALT LAKE CITY, UTAH.

matter as any idea about the truth of the faith compiled by Joe Smith and his successors. So far from considering the Mormon creed as the social and religious system of the best colonists in the world, I agree with those who think that it contains within it elements of decay. They have been successful, not on account of Mormonism, but owing to causes with which their faith had nothing to do. Already it is decaying. The sons of Joe Smith, the founder, have seceded from the main body of the church. Many adherents grumble at the church-dues they have to pay, while others, finding that, now civilisation has overtaken them, they have nothing to gain, but much to lose socially by belonging to the Mormons, and that they will be protected by the Government, are falling away. Congress, by the “Edmund’s Law,” has disfranchised all polygamists, and under the supervision of the “Commission,” a “Monogamist” legislature has already been elected. Polygamists are, therefore, no wives, and their children are illegitimate, and, unless under a direct provision made for them, cannot share in their father’s property. This will,

VIEW OF CLEAR CREEK CAÑON, COLORADO

be the end of it. The lawful children will assert their rights to the estate of their intestate father. Yet, in 1881, the Commissioners appointed to enforce the Edmunds Law report that though all polygamists are by it disfranchised, and polygamy rendered a penal offence, polygamic marriages are on the increase, and that the last elections resulted in such a sweeping return of Mormon candidates, as to suggest that the Federal Government will finally require "to take into its own hands all civil power" in the Territory. (Views on pp. 57, 60, 61, and 64.)

EMIGRANT TRAIN IN COLORADO. (From an Original Sketch.)

NEVADA.

We have said so much about the physical geography of the Great Basin, about mines and miners, and about social life generally on the Pacific, that a very few words will suffice about Nevada, which, though politically separate from California, to which it was once united, is yet socially a part of it. It has an area of 110,070 square miles. Its population was, in 1880, 62,266, of which 53,556 were white (20,000 females), and 5,416 Chinese. Agriculturally, we have already sketched it: from this point of view it is of no moment. Mines constitute its only riches, silver and gold being abundant, but quicksilver, lead, and antimony are also found. The chief town is Virginia City (which in 1884 had over 9,000 inhabitants), but the capital is Carson, with a population of 4,300. Its gold and silver yield we have already spoken of. In 1882 it was 10,363,376 dollars.

MONTANA.

Montana is very correctly named. It is in reality the Rocky Mountain Territory, west of the 111th meridian; its borders, indeed, lie along the crest of that range and the Bitter Root Mountains. Its principal towns are Helena, the capital, 4,266 feet above the sea, and with a population of about 3,700; Butte City (about 3,400 people); Deer Lodge (at an elevation of 4,654 feet), Fort Benton (1,618 people); Glendale, Fort Keogh, Bozeman (5,000 feet), &c., none of which have 1,000 people. The census of 1880 showed that 39,159 people ought to be credited to the Territory. Of these, 346 were "coloured," and 1,765 Chinese. The males exceeded the females by nearly 18,000. Only 4,513 were employed in agriculture, and 4,813 as miners. The tribal Indians are Flatheads, Pend d'Oreilles, Kootenays, Mountain Crows, River Crows, Blackfeet, Bloods (p. 41), Piegan, Santee and Sisseton Sioux, Yanktonais Sioux, Unepapa Sioux, Unepalena Sioux, Assinaboines, Tetons, Gros Ventres, and a few smaller tribes, the whole numbering, in 1884, less than 20,000, including 1,663 classed as "citizen Indians." The eastern portion of the Territory—about three-fifths—consists of rolling table-lands or plains; but the west is mountainous. There are various rivers flowing east and west, but the chief is the Missouri, which is navigable to Fort Benton—and indeed at certain seasons to the Great Falls, 2,540 miles from its junction with the Mississippi—more than 300 miles from the boundary, and its tributaries also for greater or less distances. The Territory is rich in minerals, being, indeed, in its gold yield, fifth in rank among the States. The silver mines are more valuable by nearly a million dollars than those of gold, while the copper and lead yield amounts to one million. In the year 1880, the bullion product was estimated at 4,710,835 dollars, but this is a falling off from previous years. In fact, there has been a gradual decrease since gold was first mined in the Territory in 1861. The climate is healthy. Little rain falls, and irrigation is in general required before crops can be raised. The average temperature is higher than in regions farther south. Cattle winter out, so little snow falling that they can usually find food enough to subsist on. The climate is generally too cold for Indian corn, but most of the temperate crops grow well. Buffalo, bear, and antelope abound. In 1880, there were 1,519 farms, containing 262,611 acres of improved land, but quartz, flour, and saw-mills, breweries, and several copper-smelting works, formed the chief industrial establishments of the Territory. The Northern Pacific Railroad and some of its branches intersect the Territory. The assessment, according to the report for 1882, was 33,211,312 dollars. Part of the "Wonderland" of America is in Montana, but we shall have occasion to describe it when speaking of Wyoming. Ranching and other industries are proceeding so rapidly that the Governor intimates his belief that by 1887 the population will be fully 200,000. In his report for 1884 he puts the entire number of inhabitants at 84,000, which may be accepted as a liberal estimate.

COLORADO.

Colorado is in shape almost that of a parallelogram, averaging in length 380 miles, and in breadth 280 miles. In 1880 there were 194,327 people, and 4,316 tribal Indians (chiefly Utes) in the entire State. These returns show that the civilised population has

almost quintupled itself in the course of ten years, while the "coloured people," now 2,435 in number, have increased six-fold, and the Chinese, who are put at 612, more than eighty-four fold. There can, however, be no doubt that for some time past Colorado has been looked on as a kind of emigrant's paradise. It is a favourite idea with young Americans, and with middle-aged people whose race in life has been rather tardy, that the proper thing for them to do is to remove to one of the newest States, and "grow up with it." To this practice may be attributed the rapid settlement of Nebraska and Kansas, and of the State under consideration. Its principal town is Denver, the capital (p. 69), which in 1880 contained 35,629 people. There are, however, now 5,000 children alone on the school register in this town, and its settled population—exclusive of visitors, averaging 10,000 to 15,000—may be set down at 40,000. To this may be added a floating population of miners of from 2,000 to 5,000, the gold-diggers of Colorado being no less addicted to wandering than those of other regions. In 1876 there was a hegira of 600 of them to the Black Hills, while hundreds who left a few years ago to try their luck in Utah, California, and other States are now returning. The other principal towns* are Leadville (15,000), Silver Cliff, Pueblo, and Custer, each with from 4,000 to 5,000 inhabitants, and Colorado Springs (4,250), Georgetown (3,300), Boulder (3,069), and Central City, with upwards of 3,000, while there are ten or twelve other towns which number about 1,000 each, with hundreds of smaller villages and miners' camps scattered throughout the State. A fair estimate of the present population of the entire State is 200,000. Of this number, about one-half are settled in the large towns and cities; some 50,000 in the mining camps along the mountains, from Sunshine District to San Juan. The other 50,000 are scattered about on the plains, principally engaged in farming, dairying, cattle-rearing, and wool growing.

The oldest and greatest industry of Colorado is mining. Since their first discovery in 1858, the gold and silver mines have produced upwards of 84,000,000 dollars, an average of over 3,000,000 dollars per year. Of late years there has been a large decrease in the yield of gold. In 1874 it was 5,362,000 dollars; in 1875, nearly 6,350,000 dollars; and in 1876, about 7,000,000 dollars; but for 1882, it was only 3,360,000 dollars, the yield of silver being four times that amount, though it is safe to say that the time is not far off when California will be the only conspicuous rival of Colorado. Fortunes do not often suddenly thrust themselves upon people in this State, but there are some mines whose product runs as high as 350,000 dollars, a number that yield 100,000 dollars, and many from 50,000 dollars to 75,000 dollars per annum. It is chiefly gold quartz that is mined, placer diggings not being so widely spread or so generally profitable as in some of the States farther west (Vol I., p. 247). Next to the mines, the produce of the farms, or, as they are called, the "ranches," claims attention. At the outset, it may be well to say that the farmers manage to get through the season year after year without any scientific or laboured system of irrigation. The farms generally lie along the valleys, near streams, and a large canal is built to carry the water along the upper part of the farm, from which small lateral ditches bring it over all parts of the land. The water is shut off when not needed by means of gates. In

* For most of the statistics which follow I am indebted to "The Tenth Census of the United States" (1880), and to supplementary data derived from various trustworthy sources.

many seasons there is rain enough for the crops to do without irrigation, but generally from the middle of June until harvest is the "dry spell," when they need attention. The cereals most abundantly produced are wheat, potatoes, barley, and all kinds of vegetables. Indian corn is not grown to any extent. All other kinds of grain and vegetables are produced in sufficient quantity to more than supply all the demands of consumption in Colorado. During the last few years, as in many other of the Western States, there has been great loss from the ravages of grasshoppers, notwithstanding which enough was

PACK TRAIN READY FOR LOADING. (From an Original Sketch.)

raised to supply all the home markets. Wheat is the great crop. In 1880 over 1,425,014 bushels were produced. The total agricultural product for that year is estimated to have been worth 5,035,228 dollars, being double that for 1870, and had it not been for the spoliations of grasshoppers, the total amount for 1876 would have been nearer 9,000,000 dollars, thus exceeding the value of the mining product.

None of the industries of Colorado has developed faster or more profitably than cattle-raising. There are at the present time about 792,000 head of cattle grazing in the State, the value of which at the assessed rate is very near 12,000,000 dollars. The natural increase of herds per year is about 50 per cent. That would make the number in 1884 about 1,200,000, and as 150,000 represents about the number marketed and driven east, the figures given above, as the number now in the State, are presumed to be about correct.

STREET IN DENVER, COLORADO (1873).

Wool growing comes next in importance. The assessment of 1880 showed the State to contain 1,091,443 sheep, valued at 2,180,000 dollars. The increase in this industry is very marked, since estimates compiled by the Rocky Mountain Wool Growers' Association place the number of sheep in Colorado in 1884 at fully one half more than they were in 1876. The number marketed in 1880 was about 151,000 head. The wool clip reached 3,197,391 lbs., worth about 640,000 dollars.

Copper, iron, and other metals are found; and as coal has been discovered, they may be expected in time to be worked to a great extent. Already the Colorado coal is used by all the railways in the State. In 1882 about 1,061,479 tons, worth 2,388,328 dollars, were mined.

The climate is good and equable, the winters mild, and the summers cool and bracing. Sultry nights are unknown; while the beautiful scenery and suitable climate have made the State a favourite resort of invalids. About one-third of the country is suited for agriculture. In 1880 the number of improved acres was 616,169, a mere fraction in a State comprising within its bounds 106,500 square miles, or, 68,160,000 acres. Game birds—such as the wild turkey, mountain grouse, sage hen, prairie chicken, ducks, geese, swans, ptarmigan, &c., abound. The common mammals and other animals of the Western States are also frequent; but, perhaps, the most notorious of the Colorado fauna is the potato beetle (*Doryphora decemlineata*, p. 72), which feeds naturally on a wild species of *Solanum*, but since the country has been settled up it has attacked cultivated plants, and more particularly the stalks and leaves of the potato. Since 1859 it has travelled east 1,500 miles—in a straight line—carrying devastation wherever it goes. It has for some time past been plentiful on the Atlantic seaboard: it has also been seen in Germany; though curiously enough it is almost unknown in Colorado proper, where, however, grasshoppers are an even sadder pest.

There are various other industries and manufacturing enterprises of large and increasing importance. The pine woods furnish material for about eighty lumber mills, though the once abundant forests are now greatly thinned by the reckless destruction to which they have been subjected. The wool product has suggested woollen mills, and two or three of large capacity are in operation. Tanneries have been started up to utilise the hides. Many classes of business growing out of the chief industries give employment to capital and labour. Stamp mills, smelting, reduction, and sampling works, ore dealers, assay offices, miners' supply stores, and the like, become the necessary outgrowth of the mines, while live-stock markets and slaughter-houses for preparing dressed beef to ship to Eastern markets, are the natural attendants of the Colorado cattle interest.

Commercial facilities are greater than were enjoyed by any other new State at the time of admission. There were, in 1876, eight railways, working 919 miles of road, but as several stretches have since that date been completed, leaving out of account those begun, the State has now fully double that mileage. The emigrant's waggon (p. 65) is year after year getting a less familiar object, and the pack-train* (p. 68), now such a common sight all over the West, will in time be replaced by a more expeditious mode of transit for

* That is—a train of mules or horses, fitted with pack-saddles, and employed in carrying goods to remote localities still unconnected with civilisation by means of waggon-roads.

merchandise. There are several express companies (p. 16), reaching all the principal towns, stage lines to most of the remote hamlets and mining camps, and a railway line to Santa Fé, with connections to El Paso, Albuquerque, and Tucson, in Arizona. With the spread of railways, the Indians have been compelled to abate their offensiveness. They no longer attempt to stay the progress of the iron horse by stretching horse-hair lariats or ropes across its path. The wild speculation which gave the State a bad name for years has also given place to a quieter, less adventurous enterprise.

Educational and religious interests are well cared for. There is an excellent public school system; the number of school districts being 154; the number of school-houses, 314; and value of school property, 977,213 dollars. There are besides two Universities, agricultural, mining, scientific, and theological schools, seminaries, and academies. For the dissemination of news, there are eighty-seven newspapers and periodicals. All religious denominations are represented. The Methodist Conference have the most churches and societies supplied with regular preaching; the Methodist Episcopal Church, a smaller number; while the Presbyterian, Congregational, Episcopal, Catholic, and other societies are represented in all the larger towns.

The value of property, real and personal, in the State is about 149,000,000 dollars. State, county, and municipal taxes of all kinds in the larger towns vary from six to twenty mills on the dollar, and in the country and mining districts much less.

"With the mines turning out a constantly increased product under a steadily reduced expense of operation; the farms yielding abundant returns; cattle and sheep multiplying rapidly, and raised at a much less cost than in any other Western State; new business enterprises starting up day by day; trade in all branches in good condition, and capital coming in freely for investment in mines, stock growing, farming, and merchandise, and an excellent climate—Colorado seems destined, in population and industries, to multiply and increase." All this, it may be remembered, is in a State comparatively new, even dating from the commencement of its territorial probation, and when the first gold was discovered not twenty-seven years ago.

The State may be naturally divided into three divisions—the mountain region, including the "park" system, the foot-hills, and the plains. The park system is the most remarkable feature of Colorado, and we shall accordingly confine ourselves to describing this point in its orography. These parks are in reality basins or depressions surrounded with high mountains, their elevation varying from 7,000 to 10,000 feet above the sea, and being well watered and wooded. The climate is throughout most of the year delightful, and always healthy. The only drawbacks are the violent storms of wind, and, in some parts of the country, heavy hail showers. The humidity seems on the increase since the settlement of the State, a fact which we have also noted about Utah. Streams which formerly dried up in the summer now flow all the year round, while the volume of others has for late years doubled. All the vegetable products of the North grow here; and owing to the rich luxuriance of the grass, the parks will in time become the grazing localities of the Western United States. San Luis Park, drained by the Rio Grande del Norte, is the most southern of them. It is also the lowest and largest of them all—7,000 to 8,000 feet above the sea—and having been long settled by a population of from 8,000 to 10,000,

chiefly Mexicans, is the most cultivated of these upland valleys. It is, in fact, a great amphitheatre of 9,400 square miles, with a surface as flat as a lake, showing every sign of it having been once the bed of an inland sea. South Park—the Valla Salada of the Spaniards—is the next in order going north. It gives rise to the South or Main Platte, which flows to the north-east, and then eastward to the Missouri. The Park is twenty to thirty miles wide, and forty to fifty long—in fine, a vast meadow at the height of 8,000 to 10,000 feet above the sea, which supports thousands of cattle. The surrounding mountains abound in gold and silver, and rich deposits of gold are worked in some places. Middle Park (averaging 7,500 feet above the sea) is drained by the Grand River to the west, and thence by the Colorado to the Gulf of California. Its outlet by the

THE COLORADO BEETLE (*Doryphora decemlineata*).

Grand River is through a magnificent defile or cañon. It is as yet unsettled, but in time will become a favourite summer resort for those who do not dread temporary isolation. The North Park is near the northern boundary of the territory. It gives rise to the North Platte, which, after flowing north and east, joins the Missouri. It is heavily timbered, and of an average elevation of 8,000 feet. It is circular in shape, and twenty or thirty miles in diameter. As yet it is little resorted to, and has few settlers, though its scenery is fine. Animas Park, a later discovery, is about 7,000 feet above the sea. These parks are separated one from the other by narrow but lofty ranges of mountains. They all abound in fish and game, and present very varied and romantic landscapes.* "The colour of the landscape" is, to use the words of Sir Charles Dilke, "in summer, green and flowers; in fall time, yellow and flowers—but flowers ever."

DAKOTA.

Dakota comprises an area of 150,932 square miles, but Bismarek, the capital, since its removal from Yankton, and containing, in 1880, 1,758 people, is inferior in population to Deadwood (3,771). The whole population of the Territory at that date was 135,177, which included 401 "coloured" persons, 1,400 non-tribal Indians, and 51,795 people of foreign birth, chiefly Norwegians, Canadians, Irish, Germans, and Chinese. There are in addition about 32,000 tribal Indians belonging to the Sioux and other septs found in the neighbouring Territory, gathered on reservations. Most of the white population are settled in the south-eastern portion of the country. The country east and north of the Missouri is principally undulating prairie, without "swamp, marsh, or slough," but traversed by many streams, and dotted with endless lakes. Along the eastern border extends for 200 miles from the south, fifteen to twenty miles broad, an elevated plateau (1,800 to 2,000 feet above the sea), called the Plateau du Coteau du Missouri. Open grassy

* See Hayden's "Geographical and Geological Survey of the Territories" (1874); Hollister: "Silver Mines of Colorado" (1867); Bowles: "Parks and Mountains of Colorado" (1869); Blackmore: "Colorado" (1869); Grestorex: "Summer Etchings of Colorado" (1874); Porter & Coulter: "Synopsis of the Flora of Colorado" (1874); Hayes: "The New Colorado" (1881); Bird: "A Lady's Adventures in the Rocky Mountains" (1879); Baillie-Grohman: "Camps in the Rockies" (1882).

plains form the basin of the Red River, while in the south-west, extending into Wyoming, are the Black Hills and Mauvaises Terres, or Bad Lands, full of the remains of extinct animals, the discovery of which in late years has added so much to our knowledge of the ancient fauna of North America. The Black Hills contain gold, silver, iron, coal, lead, salt, and petroleum; and, within the last few years, have taken high rank among the mining regions of the United States. There is, as in all the prairie region, comparatively little rain; and accordingly the climate is dry and pure, and consumption an almost unknown disease. Grazing is extensively followed, while the vast herds of buffalo, elk, deer, and antelope ranging over its western portion give "the land of the Dacotahs" a reputation among hunters, as its black bear, wolverine, musk-rat, otter, mink, marten, and wolf do among the North-Western trappers. In 1880 the number of improved acres was 1,150,413, and the entire value of the real and personal property in the territory 68,000,000 dollars. Dakota has, moreover, the distinction of being 394,500 dollars in debt. Much of the territory west and south of the Missouri was "unorganised," but in 1877 a new territory called Huron was projected out of this wild land,* though never actually formed.

DAKOTA OR SIOUX INDIAN.

* In reference to the nomenclature of the territory, a writer in the *New York Nation* remarks "that there is not much to be said against the name of 'Huron' for a new territory, though its selection is but a questionable 'tribute to the aborigines;' but I trust that the derivation of Pembina from *pain beni* will not make its way from the Senate Chamber to school-books and gazetteers. The name is perfectly harmless. It comes from the Chippeway and Cree name for the high-bush cranberry, *nipimina* (and *nebeminh*), literally 'water-berries.' The French of Canada corrupted this to *Pemine*, and the voyageurs and trappers made it *Pem'ina*, and gave it to two or three streams and lakes where they found the berries plentiful.

"A great deal of ingenuity has been wasted in inventing French etymologies for Indian names. The northern Indians use the dry leaves of the bear-berry (*Arctostaphylos uva-ursi*), which the Chippeways call *sagacomir*—i.e., 'ground-berry'—to mix with their tobacco for smoking. Sir John Richardson was made to believe that 'on account of the' Hudson's Bay officers carrying it in bags for a like use, the voyageurs gave it the appellation of *sac-a-commis*. A curious etymology of this sort is the one which has been found for the River Quinechien, a point at which it joins the Ottawa River, near the Long Saut. The name is *Alonkin*, and properly belongs to the 'long rapids'—*Quinechouan*, Champlain wrote it; but the Abbé Ferland informs us that it is said to have been given in memory of the first company of settlers at this point, fifteen Frenchmen, who, because they were always quarrelling, were called by their countrymen and neighbours, '*les quinze chiens*.'

"The French have, on the whole, dealt more mercifully than the English with Indian names. They have mutilated, but without mangling. A Frenchman would not have resolved Cuppaug—which means 'a harbour'—into 'Cape Poge,' or Potopaco into 'Port Tobacco.' 'A tale of love in Acadie, home of the happy,' flows more

CHAPTER IV.

THE UNITED STATES: THE PRAIRIES WEST AND EAST OF THE ROCKY MOUNTAINS.

DAKOTA is essentially a Prairie State. The great grassy plains called prairies—from the French word for a meadow—are in America especially the treeless fertile regions lying between Ohio and Michigan on the east and the arid desert on the west (Vol. I., p. 261). The western part of Ohio, nearly the whole of Indiana, Illinois, and Iowa, the southern part of Michigan, the northern part of Missouri, and portions of Wisconsin, Kansas, Nebraska, and Dakota are prairie regions, though to a less extent they are found in all the States immediately to the east of the Rocky Mountains beyond the reach of the streams flowing from their melting snow, and to a smaller extent to the west of that range. The altitude of the prairies above the sea differs. At Prairie du Chien in Wisconsin the elevation is 400 feet above the Mississippi; about the centre of the State of Illinois the average height is 650 to 750 feet, while near the northern border of the States some of the most elevated portions of the prairies are about 1,000 feet above tide water. In Iowa the *Plateau du coléau des prairies*, which divides the waters of the Mississippi from those of the Missouri, is about 1,400 or 1,500 feet above the sea. Usually the prairies are more or less undulating, though occasionally they are level and smooth. The first kind are called rolling prairies, the second flat prairies. Among the plants of these grassy plains compositæ, or the daisy and dandelion order, and especially sunflowers and their allies, are the most frequent and numerous in species and individuals.* On the borders of streams, or in other exceptionally moist localities, they are found, but west of the Mississippi they become rare, and near the longitude of 98° all but disappear. The prairies are among the richest soils of America. They are usually free from stones, and though in the rich “swales” and “bottom lands” the vegetable mould is very deep, yet the usual thickness on the Upper Prairies is from one to two feet. The sub-soil is almost invariably a clayey loam, in its lower parts mixed with sand, and occasionally pebbles. Between the 99th and 104th meridians are treeless plains, differing from the prairies in being dry and partly desert,

smoothly than would be possible for any tale of love in ‘Quoddy.’ The French softened one name, and the English roughened the other out of the same two syllables of the Abnaki original.

“As for *Huron*, there is no evidence that the name is Indian, even by derivation. Father Lalemant, in the ‘Relation’ for 1639, and Charlevoix, assure us that it is French. The Ouendate, as the Hurons called themselves—the name is not written Wyandot—had strange fashions of wearing their hair; some cut it short on one side and let it hang in long locks on the other, others trimmed it to a bristling crest, from forehead to crown. When the French saw them for the first time, some soldier or sailor, as the story goes, cried out, ‘*Quelles hures!*’—‘What beastly heads!’—and the savages soon got the nickname of Hurons. I am not aware that the truth of this story has been questioned, but I confess that I do not believe a word of it. It is too much like the *quinze chiens* and *pain beni*. *Ron* or *ronon*, as a termination means ‘people’ or ‘nation;’ and *Hou-ron* or *Hou-ronon* may be only another form of *Quendat*, or [as Sogard gives it] *Houandate*—in which *andate* probably means ‘towns’ or ‘villages.’ The name, however, is of questionable origin at best. The genuine one would be unexceptionable. Why not Wyandot or Wyandota?” In 1885, Dakota was estimated by the Governor to contain 418,000 people.

.. * Asa Gray: “American Journal of Science,” Second Series, Vol. XXIII., p. 397 (1857).

although usually capable of supporting crops if irrigated. Some Western men affect to apply the name of "plains" to these tracts, covered with the short curly buffalo grass, reserving the word prairie for the undulating regions covered with tall luxuriant grasses we have already described, though the distinction is not strictly kept up, or, indeed, possible in every case. The buffalo grasses change colour early in the summer. Hence the "plains" look yellowish-green long before the autumn comes, while the rolling hills and valleys of the "prairies" are still fresh and green.

THE PRAIRIES WEST OF THE ROCKY MOUNTAINS.

The "mound" prairies are found near Puget Sound and in other portions of the North Pacific Coast, particularly on the Nisqually Plains—grassy openings in appearance not unlike English parks—(Vol. I., p. 309). These plains are ranged among the dry prairies—in contradistinction to the wet ones—of the region to the west of the mountains. Among these may be classed the pleasant little prairies on Whidby's Island, off the coast of Washington Territory, the Willamette Prairie, Oregon, the Squak Prairie near Seattle, the small Cowichan and Comox Prairies on Vancouver Island, &c. They are generally found in the vicinity of rivers, and their soil seems to have been deposited from the waters of the neighbouring streams; though they are now elevated more than 100 feet above the bed of the river. They are composed of a thick black loam one to three feet deep, almost entirely vegetable in composition. The soil is sometimes too rich for grain, though that of other prairies near the shore is poorer and sandier. Often these prairies are scattered with oaks, chiefly *Quercus Garryana*, and a few pines, which give a peculiarly pleasant home-like aspect to these openings in the gloomy forest around. They are often—as in the case of the Nisqually Plains—dotted here and there with little lakes swarming with the fresh water turtle,* surrounded with pleasant groves of maple,† pine,‡ oak, and occasionally the Oregon ash. Scattered over these prairies are also little hillocks covered with trees—looking, at a distance, like wooded islands in a grassy sea. These mounds, I am inclined to believe, are not dissimilar in formation to the much more marked "mound prairies" between Olympia and Monticello, on the Cowlitz portage in Washington Territory. The form of these mounds is very distinctly circular, and averages, from a mere swell in the prairie, to a height of six to eight feet. They are composed of gravel, apparently brought together by the action of water; but they never coalesce, though frequently in close proximity to each other. Amid the endless theories which are advanced by local *virtuosi* and other more scientific visitors, I can find none which will at all reasonably explain these remarkable natural mounds, though they appear not to be peculiar to this prairie, but are also found in Texas. I am inclined to hazard an opinion that their origin is due to the same causes—whatever these may have been—which went to form the kames, escars, or gravel mounds generally associated with the Glacial epoch, and found scattered over many portions

* *Actinemys marmorata* (Agassiz).

† *Acer macrophyllum* (Pursh).

‡ *Pinus ponderosa* (Douglas).

of the British Islands and the north of Europe. Professor Joseph Le Conte considers them due to surface erosion under peculiar circumstances.*

Very frequently these dry prairies are covered with a thick crop of fern (*Pteris aquilina*), which is a great nuisance to the farmers, who resort to liming and other means to rid the soil of it. I am told by some experienced Western farmers that if this fern be continually cut down it will in a very short time disappear, the sap being drained off by this constant bleeding—the result of which is that the bracken very soon dies of exhaustion. In considering the origin of these prairies, we are struck

STEAMER ON THE LOWER MISSOURI.

by the abrupt termination of forest surrounding them. They seem like oases in a forest desert. At one time these prairies must have been much wider than now, and, indeed, there are evident signs that they are only remains of much more extensive grassy plains, which once extended over the valleys, until the forest encroached on them. The climate must have been at that period very different from what it is now; but everything tells us that there has been some wonderful revolution in the climate of North-West America since first it took its present contour. The prairies by the side of rivers, such as the Comox, and even the Willamette Prairies, were probably at one time of the nature of meadows, overflowed by the rivers when the volume of water in them was much more extensive than now; and it seems not unreasonable to suppose that the absence of trees on them is due to the sapping by water to which they were then subject, if, indeed, they were not continuous swamps; for

* For a more particular account of these extraordinary mounds on the "mound prairies," I may refer the reader to Gibbs: "Pacific Railroad Report," Vol. I., pp. 469 and 486; Cooper: "Natural History of Washington Territory," p. 18, &c.

swamps will, in due course, by the formation of soil, and by the decay of their own vegetation, become dry prairies—a fact I have more than once observed—or by some of the convulsions so common in a volcanic region like North-West America, they may have been suddenly drained of their superfluous moisture and become dry land. At all events, we know that the forest is steadily encroaching on the present prairies. Old settlers have pointed out to

BLOOD INDIAN.

me, on the Willamette Prairies, places on which thirty years ago they grazed their cattle, and which are now covered with a dense thicket of firs. Again, on the Nisqually Plains, is a place where some officers of Her Majesty's ships were buried more than thirty years ago. It was then open prairie. When I visited the spot it was with difficulty that we could find our way through the bush and trees which covered the ground. The Indians tell the same tale—that the forest in Washington Territory and the neighbouring country is encroaching on the prairies. These prairies support a luxuriant herbaceous vegetation: probably one-half of the flowering plants found to the west of the Cascade range grow on

them. Among these may be classed various species of buttercup, *Potentilla*, *Collomia*, *Collinsia*, *Dolicaltheon*, *Fritillaria*, *Cryptopedum*, *Aquilegia*, &c., most of which have been introduced into England by Douglas, Jeffrey, Burke, and the author, and are getting to be common garden flowers. A very characteristic plant of some parts of these prairies is the tall yellow *Oenothera biennis*, now introduced into our English gardens. Other common plants are *Delphinium azureum*, *Gaillardia*, *Lupinus*, *Sanicula Menziesii*, *Eriogonum*, *Linaria canadensis*, wild strawberries, &c. Finally everywhere, from May to June, the prairies are covered with the beautiful blue flowers of the gamass lily (*Gamassia esculenta*), which are among the most charming and characteristic flowers of North-West America. Several species of mammals are closely confined to the dry prairies or their borders.* Among these are the gopher, meadow mice, Oregon mole, &c.; and in a lesser degree the Sewellel (*Aplodontia leporina*), one of the most extraordinary of Western mammals, the Western vole, the prairie mouse, &c. Very few birds are peculiar to prairies, though some of the smaller species, shunning dense forests, frequent their borders. The shore lark and the Savannah sparrows are, perhaps, the only land birds never seen in the Far Western woods, while some water-birds frequent the marshy portions, along with the brown crane and the Canada goose, which are rarely or never seen along the sea shore.

Wet prairies are on the Pacific Coast generally formed around the mouths of various tidal rivers, such as the Fraser. They are only overflowed by the tide at its highest periods two or three times annually. The soil is rich, and produces good vegetables, but in summer the prairies are so infested by mosquitoes as to be almost uninhabitable. They produce a coarse grass, which is cut when in the vicinity of a market, and sold under the name of swamp hay. The extensive flats on either side of the Fraser mouth are accordingly unused, except for this purpose, though there can be but little doubt that eventually they will be regarded as valuable agricultural lands, and proper means taken to embank them. In Nova Scotia, similar tracts form the richest agricultural lands of the province.†

Sometimes the tide prairies get covered with bush, as at the mouth of the Columbia and Chehalis. At other times they are dotted here and there with clumps of trees, like islands in a grassy sea. Near Fort Vancouver, on the Columbia, there are meadows annually overflowed in some period from June to August, by the rising of the river, but it is found that if the seed is put in after the flood has subsided it prospers very well.‡ The absence of trees is no doubt due to inundation, or to the icy flood from the mountains which saps the ground. There are often found small prairies about the head waters of streams, particularly in hollows in the mountains. They are generally marshy, from the continual welling up of springs, and are covered with a coarse grass, or, where drier, with bushes. These little oases among the wooded mountains are particularly pleasant to the traveller, and even more so to his horse, as they generally form the only grassy stops on his route—that is, if it be one by which horses can be taken, a rarity in this region. Of this nature are the cranberry marshes along the coast, which curiously produce a group

* For a list see Lyall: "Journal of the Linnean Society," Vol. VII., p. 135 (1863).

† Dawson: "Acadian Geology," p. 16.

‡ Cooper: "Natural History of Washington Territory" (Botany), p. 16.

of plants, many of which are identical with the Alpine Flora, at 5,000 feet elevation on the mountains, and are composed of species found in the northern portion of the American and other continents, forming exceptions, brought about by peculiar physical circumstances, to the ordinary geographical distribution of plants in North-West America. In the smaller rivers and lakes are also found similar cosmopolites, but more truly aquatic, such as *Scirpus lacustris*, *Typha latifolia*, *Polygonum amphibium*, &c., almost universally in company with the characteristic "skunk cabbage" of the Western swamps (*Symplocarpus kentuckiensis*).

The wet prairies also support a group of plants almost peculiar to them. On the Sumass River Prairies, off Fraser River, the North-West Boundary Commission pastured their horses, but so terribly were they tortured by mosquitoes, that the animals, maddened with pain, would sometimes spring into the river and get drowned. Even the tough skins of the Indians do not escape with impunity. It is almost impossible to engage them to paddle up the sloughs leading into these swamp prairies in July, August, or September, except at very high wages. Some friends of ours, engaged in surveying these places, had to give three dollars, or 12s. 6d. per diem, with food, to their Indian canoe-men, and even then they bargained to be supplied with mosquito bars. Such is the torture inflicted by these pests, that I do not wonder at the Indian mythology ascribing mosquitoes to have originated from the ashes of the *Stal-akum kul-kul-aith*, or wicked witches, who haunted those parts—

—"In days no more remembered,
When the heavens were closer to us,
And the gods were more familiar,"

and whose evil deeds I have recorded elsewhere.*

I doubt not, however, that as settlements and cultivation extend, the mosquitoes will disappear, smoke causing their destruction. When first I visited New Westminster, a little town on Fraser River (great *on paper*,† however, and the then capital of British Columbia), sleep was scarcely possible for mosquitoes, and the faces of the people would have led the stranger to suppose that an epidemic of small-pox was desolating the town. When I last visited it, the smoke had quite driven them off.

THE PRAIRIES EAST OF THE ROCKY MOUNTAINS.

The reader must pardon this long digression regarding a part of the country we have already travelled over, and which is many hundreds of miles from Dakota, the proper subject of this section. It is, however, better to consider the interesting and important question of prairies as a whole, more especially as these most remarkable features in North American geography are very imperfectly understood, and are sometimes classed as due to the same causes, while in reality those of the West and those of the East have really nothing in common, except that all of them are more or less treeless. On the

* "Peoples of the World," Vol. I., p. 123.

† At that period the Municipal Council was advertising for tenders to "cut down the standing timber upon Argyle Crescent, Lytton Square," and so on, perfectly unconscious of any joke.

Pacific coast, circumstances no longer in force have been shown to have formed the prairies—now in the changed character of climate getting rapidly encroached on by the forests. The true prairies—which we have already noticed—are on the eastern side of the Rocky Mountains. The position and extent of these great plains we have already indicated (p. 74), by stating that the prairie country is comprised, speaking roundly, within the meridian line on the western side of Louisiana, the boundaries of Arkansas, Missouri, and Iowa, for their eastern limit; the Rocky Mountain crest for the western, with Texas at the south, and the “Barren Grounds” on the north, embracing a longitudinal parallelogram of somewhat less than 1,000 miles in width. They have a gentle slope from the west to the east, intersected by rivers running into the Missouri, Mississippi, and St. Lawrence, and into the sea on the Texan coast. They are of homogeneous formation, slightly undulating and continuous, without timbered spaces or lakes. The soil, though compact, is of a fine calcareous mould, producing an abundance of herbage peculiarly adapted to the climate. During a temporary prevalence of moist atmosphere in the spring, the delicate “gramma”* and “buffalo grasses” flourish, and are converted into hay upon the ground, by the gradually returning drought. It is upon this longitudinal belt of perennial pasture that the buffalo finds his winter food; and here, also, are found vast herds of wild horses, the elk, the antelope, and numerous other animals.† These plains are not the same throughout. Towards the north, chiefly within the British possessions, and in the influence of the Saskatchewan, is found the celebrated belt of fertile land‡. Further to the south, the absence of rain has caused the country to be very barren, and covered with sage brush (*Artemisia*). The country in the vicinity of Salt Lake City, and much of that now gone over by the Pacific Railroad, is of this nature. However, this soil is not irretrievably barren. Indeed, that quite the contrary is the case, is evinced by the magnificent crops raised by irrigation in Utah. Luscious peaches and other fruit are there growing in abundance; but look over the fence, and outside is the dreary sage brush. When first the Mormons came into this valley, they found an old trapper—Jim Bridger—then trading among the Indians. He laughed to scorn the notion of ever raising wheat there, and even went so far as to say that he would give a hundred dollars for the first ear he saw grown in the dismal-looking desert around. Irrigation, has, however, accomplished wonders, and Mormondom, in addition to feeding a population of over 144,000, supplies Idaho and the neighbouring gold mining districts with flour from wheat grown in the valley. Further to the south, the breezes from the Mexican Gulf bring sufficient moisture to render the Texan prairies fruitful. This leads us to the inevitable conclusion that the origin of these prairies and plains is due to the absence of the moisture necessary for the growth of trees. The central region is comparatively dry, and consequently treeless, except near the mountains, which act as condensers, and precipitate an amount of rain sufficient to sustain a forest growth. The rainfall is greater in that part of the continent east of the Mississippi, and hence we

* This name is applied to several species of grass. In Arizona, for instance, to *Aristida purpurea* (Nutt.); *Muhlenbergia pungens* (Thunb.); *Pleuraphis Jamesii* (Torr.); as well as to *Bouteloua oligostachya* (p. 47).

VIEW IN THE VALLEY OF THE UPPER MISSISSIPPI.

have an almost unbroken forest along the line where treeless and forest districts meet. Local causes determine the presence or absence of trees. Belts of timber border the streams and cover the more porous and absorbent soils, while level surfaces, with a firm and unporous soil, sometimes very wet and sometimes very dry, sustain only a growth of grass which can endure the alternations fatal to trees. Annual fires have their influence in extending the area of grassy surface; and over much of this middle ground the causes limiting the growth of trees could be removed, and their forest area extended.* The forces of nature are here so nicely balanced, that slight causes would make one or other preponderate. I think it is now almost universally agreed among those who have thought over the subject, that the many theories which attribute prairies to any other cause than the want of water are erroneous, or only of local value. On the great prairies west of the Mississippi, every variety of soil and surface fails to sustain trees, and there only a change of climatic conditions will convert the grass-covered surface to forest. We must, however, separate the operations which originally made these prairies from those which keep them in the condition of treeless tracts. With the first we have nothing to do: it might have been a geological revolution, or it might not. We only know that the absence of trees now is due to the causes we have explained. Heat alone has little influence in the growth of trees. Take, for instance, the rainy tropics, and the bare pampas or deserts of an equally tropical country. The one is covered with dense forest, the other is treeless.

On the other hand, the country in the vicinity of the great lakes is, though cold, densely wooded, almost to the limits of perpetual frost; while the Steppes of Russia and Asia, though under similar climatic conditions, have little or no wood, owing to their being supplied with little moisture. The equal distribution of rains is also important. It should also be remembered that the absence of rains, necessary for forest growth, does not interfere with ordinary crops. In fact, most crops will succeed better with less rain than is necessary for most trees to thrive, and in some years there is even a greater supply of rain in the Texas and Illinois regions than eastward. A consideration of the source of rains will explain why prairies have their present limits. Coming north from the Gulf of Mexico, the moisture-bearing clouds are carried more and more eastward by the westerly winds, and as the greater part of the moisture is precipitated before reaching the Ohio River, the Illinois region is deprived for many years of its due share of rains. The Texan region, lying considerably west of the line of tract of these gulf storms, has to depend on less abundant sources of rain. Now, as we go westward, the supply rapidly diminishes, until in the prairie country proper it is entirely inadequate to the growth of trees, as well as of many other cultivated products, and in some cases even grain and other herbage entirely disappear over vast tracts. From the great bend of the Missouri northward, however, there seems to be an improvement in the country. On the banks of that river, above Fort Union, there is no long interval without trees, as there is further south on nearly all the streams; and on the Saskatchewan† there is even less.

* In Iowa, for instance, it is calculated that every three years not less than 5,000,000 trees are planted, and that within considerably less than half a dozen years the forest area has been increased by 25,000,000 trees.

† For which see, *inter alia* (Vol. I., p. 239), Lord Southesk's "Saskatchewan" (1875), and Hind's "Canadian Red River Exploring Expedition" (1858).

The nature of the soil and of the underlying rocks assists much in the aridity of the country; and we, therefore, find that the line marking the junction of the carboniferous rocks of the Illinois region with the cretaceous and tertiary is a distinct limitation of many trees, as, indeed, rocks are elsewhere. Much more could be said on the same subject, but for our purposes it is sufficient to say that though different trees may require, individually, different degrees of moisture, yet, at least, sixteen inches of annual rainfall *during the growing season* are essential to the prosperity of a forest region. These facts are exemplified in the regions between the Rocky Mountains and the Cascades. The eastern slope of the Rocky Mountains, moistened by the rains condensed from the moist breezes impinging on the lofty peaks, and also by the melting of their snows, is covered with trees. The same is true of the western slope, and here a vegetation not unlike that of the Western Cascade Mountains makes its appearance, similar physical circumstances leading to similar organic products. As we go further west, out of the influence of the Rocky Mountains, the country gets more arid, until, at length, a region is reached out of the influence of either the moisture of the Rocky or the Cascade Mountains. This causes the great desert between these two ranges. When we cross the Cascades we come into a region where the moist breezes of the Pacific reach. Accordingly, we find a dense forest stretching down to the shores of the great ocean, open lands being the exception, and prairies only occurring of very limited extent, and under local conditions, with which the absence or presence of rain has little or nothing to do. But this is bringing us round to the point from which we set out; and having thus arrived at the starting point we may dismiss the vexed question of the origin of prairies, the most reasonable explanation of which I have adopted, though, unfortunately, it is opposed by so eminent a geologist as Professor Whitney.* He denies that the unequal distribution of rain will account for the absence of trees, or that the "plains" and the prairies are due to the same cause, and seeks, as did Hall, for the reason of so much of the earth being bare, in the finely-comminated soil of the prairies being more favourable to grasses than to arboreal vegetation. How is it that settlers are beginning to plant trees around their houses, and along the banks of the streams? Trees—it is a very familiar bit of knowledge—greatly affect rainfall. In Asia Minor, Greece, Spain, Portugal, Malta, India, parts of California, Australia, Switzerland, Austria, South Africa—indeed, in nearly every country—the same facts have been noticed. When forests are cut down the rain speedily runs over the surface, causing floods for a time, and aridity for long afterwards. Hence it is looked upon as excellent State policy to at once replant such deforested tracts, in order to increase and economise the showers which fall. This has been done in various countries with the best effect.† In California it is always noticed that

* See his papers—now reprinted—in the *American Naturalist*, 1876. The more general view is advocated and illustrated by Dr. Cooper in "Smithsonian Report," 1858, pp. 246—279, with corrections in Report for 1860, p. 438; Newberry: "Transactions of the American Association for the Promotion of Science" (Buffalo Meeting), 1864; Forster: "Mississippi Valley" (1869). See also Whitney on "The Earth's Treeless Regions," in "Science for All," Vol. V., pp. 124—133.

the fogs driving inland from the Pacific invariably turn to rain when they come in contact with the great red wood forests on the coast. Hence, springs in or near the red woods are never in want of a good supply of water, and owing to the same cause crops on the Coast range are not liable to fail. The destruction of forests in North-West America is controlled by no law. In Washington Territory, and some other places, the State exacts a small royalty in the shape of "stumpage," but beyond this there are no regulations affecting the destruction of timber. Indeed, a tree is looked upon as a natural enemy—the sooner destroyed the better. A man in the woods, in order to provide a "backlog" for his camp fire, will fell—without the slightest compunction—a noble pine, which would be the pride of an English forest, and the money value of which would eventually be great.

PRAIRIE AND FOREST: THEIR SANITARY ASPECTS.

The Western man, with all his hard-headed shrewdness in most affairs of life, is but a "pig-headed" sort of fellow in some other things. In the matter of a dwelling, and the selection of a site for it, he has no medium. He either goes into one extreme or the other, as circumstances lead him or gain tempts him. If he fixes his residence in a wooded country, his whole object in life is to slash and hew at the timber, until he has effected a clearing. Be the climate ever so warm, he cares nothing for that. No shady trees cast their cooling influences over his picturesque log cabin. The very sight of a tree seems an eyesore to him, and that handy little American axe of his—so different from the cumbrous, absurd, Flemish tool which we so persistently use in this country—soon helps him to remove the object of his dislike. Fire, the augur, and blasts of gunpower, assist, and soon he has what he delights to style "a right smart chance uv a clearin'." The maxim of the Laird of Dumbiedykes* has no place in his philosophy—quite the reverse. From sire to son the injunction descends, "Bring 'em down, Seth, why enumber they the ground?" And at the same time, the practical effect of it is pointed out in the "powerful heap" of pumpkins, corn, and sweet potatoes he can grow in their place. The result is, that in a few years his log cabin stands shelterless from sunshine and storm; and the tasteless, gaudily-painted mansion, which in course of years of prosperity replaces the pioneer "shanty," is equally bare, the sunshine beating down upon it in summer, and the wind howling through the seams between the contracted boards in winter. On the other hand, let us suppose our friend "locates" near prairie land. Then he goes into an opposite extreme. He commonly selects for his residence a position in a dense grove of timber, where, by the exclusion of sunbeams, and almost of the atmosphere, a continual dampness prevails. This is frequently in a low bottom, or on the banks of a stream. Though he has no intention of passing his life there, yet the fancied wealth of the timber region, its superior value, as he thinks, over the prairie, decides

California Academy of Science," Vol. III. (1866); Wilson: "Journal of the Royal Geographical Society," Vol. XXXV., p. 106, and in numerous other less accessible works; while in Croumbie Brown's "Forests and Moisture" (1877) the whole question is discussed.

* "Aye be stickin' in a tree, Jock; it grows while you are sleepin'."

his choice in favour of that position; and, neglecting the high, open, healthy prairie that spreads before him—sea-like in extent—a virgin soil, unsurpassed and all but inexhaustible, where in two years he might be the possessor of a rich farm, he seeks the immersion of a dense and damp forest, where, with his poor cabin and his habits of life, his exposure and hardships, combined with the atmosphere and the decaying vegetation, intermittent fever, or ague, is soon added to his other discomforts, and sets its pallid mark of emaciation on

HERD OF BUFFALOES (*Bison americanus*) ON THE PRAIRIE.

the countenances of the family. Incarceration may be a term less applicable to the condition of a roving backwoodsman than any other, and is especially unsuitable to his habits. Possibly the cabin you see him in is the third which he has built within the twelve months, and a very slender motive would place him in a fourth before the ensuing winter. Labouring under no restraint, his activity is only bounded by his own physical powers. He has no veneration—no associations which bind him to a place. He is, or was, always “calculating to move West.” Still he is incarcerated—shut from the common air—buried in the depths of a boundless forest. The breeze of health never reaches these poor wanderers. They are all tall and pale, like vegetables that grow in a vault pining for light. They are

all of one pale yellow, without the slightest tint of healthful bloom. In peering through a vast expanse of the backwoods, I have been so much struck with the effect that I fancy I could determine the colour of the inhabitants if I were apprised of the depths of their immersion! and *vice versâ*, I could judge of the extent of the clearing if I saw the people. The blood is not supplied with a proper dose of oxygen, from their gloomy atmosphere, crowded with vegetation, growing almost in the dark, or decomposing, and in either case extracting from the air its vital principle.* Nearly all of these new countries are subject to ague when the virgin soil is turned up. It is the chronic malady of some districts, and is really thought little of, though I cannot say I ever met any of the citizens of the numerous "Edens" of the West who, like Colonel Chollop, was "fever-proof, and likewise agur." On the contrary, my experience was that most of the citizens of a malarious neighbourhood found it convenient to arrange their engagements in accordance with their "shaking days." Most of these primitive people were rather surprised when told that in England their familiar trouble was almost unknown. "No fiver—an' aguey!" would be the exclamation; "then I calc'late the old country's pretty well cleared. That's it, cap'n. Mos' uv the land's taken up in your section, I reckon?" If the country is swampy, then the trouble is much magnified. Those who have seen the miserable sickly wood-cutters on the banks of the Mississippi, where, according to Mark Tapley, the toads are "on the wisitin' hst," will understand what I mean. When the river rises, the farms of these cachectic wretches are generally flooded. A humorous writer, who in this case scarcely exaggerates, describes at this season "crazy rail-fences sticking a foot or two above the water, with one or two jean-clad, chilly-racked, yellow-faced male misérables roosting on the top rails, elbows on knees, jaws in hand, grinding tobacco, and discharging the result at floating chips through crevices left by lost milk teeth; while the rest of the family and the few farm animals were huddled together in an empty wood flat, riding at her moorings close at hand. In this flat boat the family would have to cook and eat and sleep for a lesser or greater number of days (or probably weeks), until the river should fall two or three feet, and let them get back to their log cabin and their chills again—chills being a merciful provision of an all-wise Providence to enable them to take exercise without exertion. And this sort of watery camping out was a thing which these people were liable to be treated to a couple of times a year—by the December rise out of the Ohio, and the June rise out of the Mississippi. And yet these were kindly dispensations, for they at least enabled the poor things to rise from the dead now and then, and look upon life when a steamboat went by. They appreciated the blessing, too, for they spread their mouths and eyes wide open, and made the most of these occasions. Now what *could* these benighted creatures find to do to keep from dying of the 'blues' during the low-water season?" This refers especially to the Mississippi, and the reader can put the sketch to its discredit when, in a later chapter, we have occasion to say something about that mighty river, which, in its latter end, is worse than at its beginning. The prairie has, however, none of these drawbacks. It is a gladsome, healthy home for man. In these breezy expanses the traveller feels free. He experiences a sense of escape from the trammels of his past life, whatever they may have

* Birbeck: "Notes on Illinois," &c., p. 138 *et seq.* Bradford: "Notes on the North-West or Upper Valley of the Mississippi," p. 158.

been, and a sense of rejuvenescence rarely experienced under any other circumstances. A new world seems to have opened itself before him, in which he has, at least, an equal chance with the rest of his kith and kin. And just as he who has lived on the bosom or by the shores of the ocean cannot be satisfied with green fields and babbling brooks, so a child of the prairie, or one who has learned to love its vastness and wandered over its corn-covered fields, can never leave it without casting a lingering glance behind, and hoping in his heart that his lot will lead him there once more. It is no wonder that men sell out and go West. It is no wonder that those whom fortune is pushing to the wall in older communities escape to find solace for their woes in the solitude of the plains. They feel that man is in closer communion with nature there than elsewhere, and that his neighbour has no right and will have no inclination to bring with him the restraints and woes of towns and capitals. This is sentiment, of course, but that is the nature of the sentiment begotten of the plains.* After travelling on the prairies for days at a stretch, one feels that the world is not so narrow as we think it is after toiling through one little valley after another, never seeing more than half a mile ahead. The impression is the same that strikes one after sailing day after day on sea, out of sight of land. On the seas of grass and of water we appreciate as we can nowhere else Göthe's words, when he asks—

“To give wide space for wandering, is it
That the world is made so wide?”

At one time the only inhabitants of the Far Western prairies were the buffalo and its hunters. Now the buffalo is disappearing, or is getting year by year more and more circumscribed,† and the Indian is following it. In 1718 the herds of bison and other animals were so great along the Ohio River, that travellers were often obliged to discharge their guns to clear a passage. Boone and his associates found buffalo more abundant in Kentucky and Tennessee than they “ever had seen cattle in the settlements.” This was as late as 1780. The indiscriminate, reckless slaughter has been going on, until now the buffalo (p. 85) has retreated far beyond the Mississippi. There the massacre is still in progress. From the time when the white settlers first invaded its haunts to the present day, thousands have been killed annually in mis-called sport, while of many thousands more only the tongue, or other choice morsel, has been saved, the carcass being left entire as food for the wolves, and other wild beasts, or to poison the air by putrefaction. At other times, they have been slaughtered by hundreds, and even by hundreds of thousands, in a single year, for their hides alone. Such has been the case not only in late years on the plains of Kansas, but during the last century east of the Mississippi, from Kentucky to Western Pennsylvania, so many buffaloes being sometimes killed in single localities that their murderers would be driven away from the immediate scene of slaughter by the effluvia arising from the remains of their defenceless victims. The same is true of the various species of deer, and of almost every other animal, the slaughter of which could afford profit, amusement, or gratification of any sort to man. The extermination of the Indians has been almost as rapid. The whole route over which the Pacific Railroad now runs is dotted with the

* St. John: “The Sea of Mountains,” Vol. I., p. 50 (1877).

† Allen: “The Buffalo” (Memoirs of the Museum of Comparative Anatomy; Cambridge, U.S.) 1876.

graves of the early pioneers and their enemies. The Platte is to the American almost as classic ground as the Tiber is to the European. The one is redolent of the early history of the New World—the other of that of the Old. The wild men—white and red—are giving place to hordes of Eastern emigrants, who are covering the land; and where only a few years ago were Indian wigwams, towns are springing up along the line of the great Trans-Continental Railroads.

STATION OF THE PACIFIC RAILWAY AT OMAHA.

CHAPTER V.

THE UNITED STATES: WYOMING; THE WONDERLAND OF AMERICA.

OF *Wyoming*, after the account we have already given of the prairies, little need be said. It is 350 miles long from east to west, and 280 miles from north to south. Its area is 97,883 square miles, or 62,645,120 acres, of which very few are improved. In 1880, indeed, only 83,122 were. The country is in general mountainous, and comprises high level plains. The Pacific Railroad runs through it. It enters the Laramie Plains by a pass 8,262 feet in height, and crossing these prairies, which are on an average 7,000 feet high, to Bitter Creek, attains, at the watershed at Benton, near Bridger's Pass, a height of 7,534 feet. Two hundred miles west, the Wahsatch Mountains are reached, and passed

at an elevation of 8,271 feet, when the line descends the Weber and Echo Cañons to Salt Lake Valley. The Laramie Plains were long a battling-ground of the Indians. Here they frequently made a stand, and disputed the right of way to the railway-makers. The point at which the railway passes the mountains is the small village of Sherman, but the traveller is unconscious of it. He is even disappointed. He sees nothing but a number of mud and sand-hills, and can scarcely realise that this is the summit of the Rocky Mountains. Yet, if he attempts exertion, he speedily discovers that the atmosphere is

YELLOWSTONE LAKE, WYOMING.

entirely rarefied. He feels lighter and brighter, and everything seems in clearer relief than in the valleys. The line enters Echo Cañon soon after passing over Dale's Bridge, a very fine work spanning a stupendous height. This point is nearly 1,000 miles from Omaha (p. 88). "Before reaching that city," writes Mr. St. John, "he has travelled 402 miles from Chicago, through a country of cultivated prairie, and that has been succeeded by days and nights of rolling prairie, and level plains, the greater part of which has been wild as when the waters first receded and gave birth to the land. Fifteen hundred miles of prairie in its different forms and stages have accustomed the eye and mind to a land of pasturage and corn-fields. Then, with only a little preparation, one darts into a valley from which the mountains rise in diverse precipitancy on either side. On the south side, their face, though serrated by numerous little gulleys cut by the melting snow, and rocky throughout, is comparatively smooth when placed within a field of sight that takes in the opposite side of the pass, and beyond receiving an occasional glance they are forgotten and unnoticed by the many."

"It is north of the cañon that all eyes are directed as the cars move slowly through. It is not the heights of the precipitous cliffs that give them grandeur, for though they are high they are below the snow level, and not higher than, if so high as, the more sloping mountains opposite. But they have thrust themselves forward in bold, bright red bluffs and promontories without vestige of plant or soil, their faces varied by eaves and weather-worked indentations and sinuosities; pitted into extraordinary irregularities by the storms of ten million seasons, and capped by rocks of fantastic shape, that in one instance look like a sentinel on duty, in another like the bastion at the angle of a fortress, in another like the prow of a ship, and so, throughout the length of the valley, ever presenting on the summit of the mountain, or on some ledge or peak of its bold red face, an exaggerated lineage of some familiar form." The train runs through this picturesque pass in a few hours, and enters Weber Cañon, which is as beautiful if less wondrous strange than that which lies in such close companionship to it. It is practically the commencement of that Mormon land which we have left. It is the long funnel through which we enter the beautiful valley of the same name, entirely surrounded by high snow-mottled peaks of "The Rockies." Wyoming is drained on the south-east by the north branch of the Platte, while the Yellowstone, rising in the Yellowstone Lake (p. 89) and its branches, flows through the eastern and northern parts. In the south-west is the head stream of the Green River (p. 56), which rises in the angle made by the Wind River and Wahsatch Mountains, near the source of the Lewis River and the headwaters of the greater Missouri. The climate of Wyoming is, owing to its elevation, cold. No grain will ripen; but, on the other hand, the grass is always fresh, and accordingly stock is largely reared, wool to the extent of 692,000 lbs. being produced, while the Sweet Water Diggings have yielded on an average 5,000 dollars per annum. There are extensive mines of Tertiary coal, and vast deposits of iron and other metals have been discovered, so that Wyoming, though it is hardly likely to be a competitor of Colorado, or even of Montana or Dakota, may attain a greater population than 21,000. The Indians in the territory are the Shoshones and Bannacks.

A New York journal, in drawing attention to the comparative ignorance which prevails with regard to certain American States and territories, cites the case of Wyoming as an example. It asks "how many people east of the Rocky Mountains are aware that Wyoming has the largest iron deposit in the world, and larger deposits of coal than Pennsylvania itself; that it has also the only known natural deposits of soda, and that it has the largest oil basin on the face of the globe? Yet this little-known territory possesses all these advantages. In the heart of the territory is a mountain of solid hæmatite iron ore, with 600 feet of it above ground, more than a mile wide, and over two miles in length; a bed of lignite coal big enough to warm the whole world for centuries; eight lakes of solid soda, one of them over 600 acres in extent and not less than 30 feet in depth, and a petroleum basin which contains more oil than West Virginia and Pennsylvania combined. But up to the present time Wyoming has not had a blast furnace nor a derriek; now all is to be changed. The great railway roads are moving to the rescue; derrieks are going in, oil wells are to be sunk at once, capital and brains have combined, and it is expected that the territory, teeming with a busy, intelligent, and prosperous people, will soon take her place as one of the wealthiest and most important of the States and territories in the American Union."

THE "WONDERLAND" OF AMERICA.

We have lingered long in the West. We must linger yet a while longer. The Eastern States with their teeming industries are still before us, and the South, yet smarting under the recollection of the lost cause, is close at hand. Still a steam-engine or a plough is only a steam-engine or a plough all the world over. One industry is much the same as another industry, whether it be in Europe or America, and after a country has been settled up for a century it ceases to have many characteristics beyond those with which nature has already supplied it. Accordingly the Eastern States, so often described and so accessible, will have what may be thought unduly small space devoted to them compared with that which the wild lands west of the Mississippi have had. The better-known and more civilised portions of the Western Continent are uninteresting so far as their scenery goes. Excepting the lovely Hudson, the beautiful Lake George, the mountainous districts of New England, of Virginia, and other spurs and offshoots of the Alleghanies, I quite understand Lord Dunraven thinking the country between the Alleghanies and "the Rockies" flat, dreary, and uninviting. "Exceedingly graceful is the maize plant when its silken tassels droop in the hot sunshine amid the dark green covering leaves. Yet the eye wearies of interminable corn-fields, bounded by untidy and fortuous snake-fences. Nothing is more vulgar-looking and unkempt than recently-cleared land. The face of Nature, shorn of the beauty of its natural covering, looks mean and dirty; and, as compared with its appearance when clothed in the forest, resembles the contrast between a man's countenance when disfigured by a coarse stubby growth of a week old, and the same when adorned with the soft flowings of a patriarchal beard. Blackened stumps stand thickly in the foreground amid rocks and weeds, and the forest seems to huddle itself back out of reach of the fatal axe. The beauty of nature is destroyed, and is not succeeded by the artificial beauty of civilisation." The plains are charming from their vastness, their glorious sunsets, and exquisitely delicate covering; but though fascinating at first, and always pleasing, they cease after a time to charm. I cannot, however, coincide in the opinion of the graphic writer whom I have quoted, that they are "inexpressibly sad and mournful." The great attribute of the wilder parts of the continent is the stupendous scale on which everything is found. Rivers are great, plains are great. The mountain peaks, if not beautiful like the much smaller ones of the Alps, are yet high; the lakes are seas; the forest jungle stretches for hundreds and hundreds of miles. Even the so-called Rocky Mountains extend the whole length of the continent, and in some places are 500 or 600 miles wide, and comprise important ranges dividing great and fertile plains, and containing important valleys. As for the defiles which the currents have sawn out for themselves, they are simply unparalleled in any other part of the world. The cañons of the American rivers stand *per se*.

Lord Dunraven, to whom, as well as to Professor Hayden, I have much pleasure in acknowledging myself indebted for much of what follows, gives so excellent a *coup d'œil* of the region in the centre of America which affords the finest scenery, that though it has already been briefly sketched in connection with the geography of the country, I

cannot omit quoting it:—"Comprised," writes this lively traveller, "in the territories of Montana and Wyoming there is a region which contains all the peculiarities of the continent in a remarkable degree, and which, moreover, is exceedingly interesting, on account of its scenery, its geography, its mineralogy, and its sport. Although the altitudes are not so high as in other parts of the continent, it may be truthfully called the summit or apex of America. There the waters flow in all directions, north, south, east, and west. There it is that great rivers rise, running through every clime, from perpetual snow to tropical heat. On the one side glance the currents destined to mingle with the tepid waves of the Gulf of Mexico; on the other, up the rapids, leap the salmon ascending from the distant waters of the Pacific Ocean. It is the geographical centre of North America. It is essentially 'the Great Divide.' Roaming at will through the trackless wastes that compose and surround this region are to be found the best representatives of the fast-vanishing aboriginal race. By the great bend of the Yellowstone are grouped the tall lodges of the gigantic Crows, men of six feet four or five inches in height, with long hair reaching in heavy plaits to their knees. From Idaho come parties of Bannacks, great raisers of stock, and traders in horses. Pend d'Oreilles, Gros Ventres, Flatheads, Bloods (p. 77), and Piegans, warlike Blackfeet, Assinaboines, and Sioux, wander through the hunting-grounds, seeking their meat from God, stealing horses, hunting, and warring upon one another in something like their natural freedom. Some of these are very hostile to the pale-faces, and much to be dreaded, like the well-armed and numerous Sioux, or, as they style themselves, Dakotas (p. 73); others are friendly to the whites, like the Crows, Snakes, Bannacks, and their kindred tribes. A few, such as Nez Perces and Bannacks, are semi-civilised, cultivating a little land, and rearing horses and cattle, possessing farming implements, and using in war or for the chase the newest fashion in repeating rifles, and the latest thing out in revolving pistols. Others, such as Blackfeet and Assinaboines, are primitive and unsophisticated, depending in a great measure upon their ancient weapons, the bow, the lance, and the club, and subsisting entirely by the chase—wanderers who have their homes far to the north in British territory. In this same region are still to be found great herds of wapiti—nobler representatives of the deer tribe, and soon to be numbered among things of the past. In the swampy flats, among old beaver dams, where willows and alders grow, or among the thickest groves of young firs, still linger the largest of existing elks, the moose. Poor *Cervus alces*! your ungainly form has an old time look about it. Your very appearance seems out of keeping with the present day. The smoke of the chimney, the sound of the axe, are surely, though slowly, encroaching on your wild domains. The atmosphere of civilisation is death to you; and, in spite of your exquisitely keen senses of smell and hearing, you, too, will soon have to be placed in the category of things that have been. In the valleys are both the white-tail and black-tail deer. On the little prairies, open glades, and sparsely-wooded slopes, grazes the small mountain bison or buffalo, whose race has also nearly vanished from the scene; and not far distant are to be found herds of his congener, the great bison of the plains;* for down in the Judith basin lie the hunting-grounds where the Crows go every summer and winter in search of the prairie buffalo.

* This one is only a race of the other. Both are the *Bison americanus*.

In summer they kill them for their flesh, in winter they utilise their skins to make robes and houses for themselves. Prong-horn antelopes, the only specimen of the species

CLIFFS IN THE GRAND CAÑON OF THE YELLOWSTONE, WYOMING

on the continent, and the only known variety in the world that carries a branching horn (Plate VI., Vol. I.), are very numerous on the plains and foot-hills. Clear against the sky-line, standing on some jutting crag, may not unfrequently be seen the massive

stately outline of a bighorn, or mountain sheep,* a near relation to the mouflon or argali; and far up in the wildest fastnesses of the range, among untrodden peaks, wild goats,† distantly allied to the Eastern ibex, have their inaccessible abode. If this last be not sufficient, and it is to be considered that an element of danger is necessary, the sportsman will be glad to learn that nowhere, save perhaps in Southern California, will he be more likely to encounter *Ursus horribilis* (the grizzly bear). If he has ever pursued or been pursued by that unpleasant beast, he will be gratified to learn that, as a rule, pine-trees are numerous and not difficult to climb."

Every year the wilds of America get more circumscribed, and though there will be always localities impossible to cultivate, and without attraction to settlers, these spots will not be the fertile valleys and prairies of the West. One year nothing is heard in one of these solitary places save the barking of foxes, the dismal howls of coyotes, or the "coughing" of deer. Next summer, when the hunter, oblivious of events—the Rip Van Winkle of twelve months—arrives he finds that wheat-fields have taken the place of the buffalo grass, and the silky tassels of maize wave where only a short time previously rank weeds or thickets of reeds grew; and if he comes back still later he will hear the whirr of the threshing machine, or witness the citizens of some mushroom town, with a high-sounding name, assembled to celebrate the Fourth of July, and listen patiently while some local orator draws out that famous declaration in which such hard things are said of "George, King of Great Britain," and his subjects who thought with him. One of these few thoroughly wild regions is that which has been called the "Wonderland of America," from the fact of its containing so many natural objects of interest. It is situated in the region we have sketched in Lord Dunraven's words, but is principally in the territory of Wyoming. Here the United States Government have set aside an extensive tract as a "national park," and, looking forward to the time when the country would be more densely populated than now, have reserved it from settlement. The region is usually called the "Upper and Lower Fire Hole Basin," or the "Geyser Basin," or more comprehensively the "Upper Yellowstone Country." The area of the reservation is 3,578 square miles; and, roughly speaking, it is contained within the meridians of 110° and 111° west longitude, and 44° and 45° north latitude. Its general elevation is about 6,000 feet above the sea level, while the wall of mountains which surround it on every side attains a height of from 10,000 to 12,000 feet. Frosts occur every night in almost every month in the year, so that agriculture is out of the question. Indeed, in much of Montana this is also the case. At Deer Lodge (4,654 feet above the sea), nine years ago the squirrels went into winter quarters on the 12th of August, and snow fell on the 18th of the same month.

Most of the rocks being volcanic, mines are not likely to be discovered, so that in setting it aside as a national park the Government were not depriving the people of anything which could be of much value to them commercially. But though in the eyes of the farmers or miners a worthless section, the "Wonderland" is, perhaps, the most interesting district on the American continent. Its scenery is not so magnificent as that of the Yosemite Valley (Vol.

* *Ovis montana* (Cuvier).

† *Aplocerus montanus* (Richardson).

I., p. 319, where the features of this valley are mentioned, but it does not depend for its attractions on this alone. The remains of volcanic activity in this basin are among the most remarkable in the whole world. "The Mammoth Hot Springs of Gardiner's River, and both geyser basins, are situated in it. Entombed in its forests, at a height above the sea of 7,788 feet, lies a large and lovely lake, which is, with four exceptions,* the highest body of water of any considerable size in the world; and in the snow that falls upon its summits are born four of the largest rivers of the continent. On the north are the sources of the Yellowstone; on the west, those of the three forks of the Missouri; to the south-west and south rise the springs of the Snake and Green Rivers, the former gaining the North Pacific [as a tributary of the Columbia], the latter finding its way to the Gulf of California [as a tributary of the Colorado]; and lastly, in the south, head the numerous branches of Wind River. Thus it is, as auctioneers would say, a most desirable park-like property; and if Government had not promptly stepped in, it would have been pounced on by speculators, and the beauties of nature, disposed of to the highest bidder, would have been retailed at so much a look to generations of future travellers."† We have figured some of the localities and other features of the "Wonderland." Though these sketches (pp. 89, 93, 96, 97) must stand in the place of any extended description, we may append a few words explanatory of some of the more interesting of the places mentioned.

The "Mammoth Hot Springs" on Gardiner's River (p. 96) are the remains of the gigantic volcanic fires that shook the whole of this region at one period in its history. The springs are calcareous, and vast quantities of lime are deposited from them. Many invalids flock to the springs, the waters from which are conveyed into rough wooden troughs, which in a short time become coated with a fine smooth marble-like enamel derived from the springs. An area of about two miles is occupied by the calcareous deposit from these springs, and in some cases even the trunks of dead trees are standing in six or eight feet of this material, the accumulation of which gives a strange weird aspect to the whole of the district. The temperature of the springs varies from 94° Fah. to 200.9° Fah., and their elevation above the sea level is 6,779 feet. Lime, silica, ferric oxide, alumina, and a trace of soda and magnesia, are the materials shown by analysis to enter into the composition of these hot springs. The only other similar spectacle equal to these is said to be found in the hot springs of Te Tarata and Otukapuaranga of New Zealand, where similar terraced fountains are found. At these springs there are, however, fine geysers, which are not found at the Mammoth Hot Springs. "The central spring merely bubbles constantly, and the overflow of water from it is moderate, and does not vary much in the quantity at different times discharged." Enormous geysers have, however, to all appear-

* These exceptions are Lakes Titicaca in Peru, and Uros in Bolivia, which are respectively 12,816 and 12,359 feet above sea level; and Lakes Manasarowak and Rakas Tal in Tibet, both of which lie at the elevation of 15,000 feet. In the United States, however, are small lakes at a higher elevation than Yellowstone Lake. For instance, Twin Lakes, Colorado, are situated at the height of 9,357 feet; Osborn's, in the same State at 8,821 feet; and Lewis, in Wyoming itself, at 7,882 feet.

† Dunraven: "The Great Divide," p. 16. In this work will be found the best general account of this country, and the routes to it.

ance, at one time existed on Gardiner's River, but they are now silent. The Yellowstone Falls is another of the sights of the "Wonderland." Where the Yellowstone River leaves the lake of the same name, it flows in a certain steady current until it reaches the mountains, which oppose its passage to the north. It then, to use Lord Dunraven's words, "performs a series of gymnastics over rapids, cascades, and waterfalls, as if exercising its muscles and sinews, preparing itself and getting strength for the mighty effort by which it tears a passage through the granite flanks of the range. A mighty effort, truly, or rather a vast expenditure of force, has been employed in clearing the

THE HOT SPRINGS OF GARDINER'S RIVER, WYOMING.

Grand Cañon, a rent in the mountains over twenty miles long and of vast depth (p. 93). Where the river enters the cañon the sides are from 1,200 to 2,000 feet high, and further down they rise to a greater altitude, an altitude which has never been determined, for the depth of that chasm has not yet been explored or trodden by human foot."

Both the Falls of the Yellowstone are caused by basaltic dykes or walls, which traverse the rocks at right angles to the course of the stream. The falls are neither very high nor very romantic, but still they have a certain strange beauty of their own—"a wild loveliness peculiar to them—and what they lack in volume, power, and general grandeur is amply atoned for in the pre-eminently distinctive character of the scenery about them, and by the lavish display of colour and strange forms of stratification which distinguish their surroundings. The scene is so solitary, so utterly desolate, the colouring is so startling and novel, the fantastic shape of the rock so strange and weird, that a glamour of

VIEW, OF THE FALLS OF ST. ANTHONY, MINNESOTA.

enchantment pervades the place, which, though indelibly impressed upon my mind, is yet quite impossible to describe," and the falls are in reality a series of falls, the highest cascade being 397 feet. At "Crater Hills" are hot sulphur springs, and near by this two "buttes," of 150 to 170 feet respectively, which give the name to the locality. These mounds are composed of calcareous deposit, impregnated with iron and sulphur. The water in the springs also contains a considerable amount of sulphuric acid. At Mud Springs are some geysers, which cast up mud and water about twenty or thirty feet high, or sometimes as high as forty feet; but beyond this fact do not differ greatly from any other geysers of the kind. The river close by is full of trout of a large size and fine quality to look at. But they are full of insects, not only in the intestines but in the

VIEW OF TOWER FALLS AND COLUMN MOUNTAIN, WYOMING.

flesh also. From the scars on the outside of the fish, it would seem as if the insects ate their way completely through the muscles; and when these get the upper hand of the trout he usually becomes "a lanky, dull-coloured, ugly-looking brute." The prevalence of these parasites seems due to the warmth of the water, or to the presence of the mineral substances in solution. For it is remarkable, as the author whom I have so frequently quoted remarks, that whereas a trout entirely free from them is almost unknown above the falls, he never heard of a wormy fish being taken below them, or even between the Upper and Lower Cascades. The Lower Fire Hole Basin is another remarkable place in the National Park, though not equal to the upper one we have already noted, and from which it is separated by a low divide. Still there are in it a great number of geysers exhibiting

an infinite variety of fine structure, appearance, and size, "some small, some large, meriting almost to be called little lakes, and containing vast volumes of boiling water; others mere cracks or fissures in the surface, occasionally ejecting air or liquid, like the diminutive pulling-holes one meets with on the sea-shore." Sometimes it is silica or flint that is deposited; at other times iron, or silica and iron together, mixed in some cases with sulphur also. Old springs are here constantly dying out and new ones springing into life, and pine-trees standing near springs, coated with deposit, and yet in full life, show that the outbreak of these springs must be something of very modern date. Numerous bare patches in the forest indicate where springs and geysers once have been, and in many little lakes or ponds are buried the remains of extinct geysers. There are also various mud volcanoes in this basin. The Fire Hole River flows through the basin. Its waters are warm, and much appreciated in cold weather by flocks of geese and ducks. The whole of the river sides are "honeycombed and pitted with springs, ponds, and mud-pots furrowed with boiling streams, gashed with fissures, and gaping with chasms, from which issue hollow rumblings, as if great stones were rolling round and round, or fierce, angry snarls and roars. The ground sounds hollow underfoot. The track winds in and out among holes that puff sulphur flames or squirt water at you; by great caverns that reverberate hideously, and yawn to swallow you up, horse and all; crosses boiling streams which flow over beds composed of a hard crust, coloured yellow, green, and red, and skirted by great cisterns of boiling, bubbling, seething water. The crust feels as if it might break through at any moment and drop you into fire and flames beneath, and animals tread gingerly upon it. You pass a translucent lovely pool, and are nearly pitched into its hot azure depths by your mule, which violently shies at a white puff of steam maliciously spitton in its face through a minute fissure in the path. You must needs examine into that ragged-mouthed cavern, and start back with more agility than grace to escape from a sudden flood of hot water, which spitefully, and without warning, gurgles out and wets you through. The air is full of subdued, strange noises—distant grumblings as of dissatisfied ghosts, faint shrieks, satirical groans, and subterranean laughter—as if imprisoned devils, though exceedingly uncomfortable, were not beyond being amused at seeing a fresh victim approach. You fancy you can hear the rattle of the loom, the whirl of wheels, the clang and clatter of machinery; and the impression is borne upon the mind that you are in the manufacturing department of Inferno, where the skilled hands and artizans, doomed to hard labour, are employed. I can compare it only to one's feelings in an iron foundry, where one expects every moment to step on a piece of hot iron, to be run through the stomach by a bar of white glowing metal, to be mistaken for a pig and cast headlong into a furnace, or be in some other way burned, scalded, or damaged."

In this valley is also the Castle Geyser, which spouts to an elevation of at least 250 feet, with a roar like the sound of a storm driving the wild waves against the cliffs added to this, which can only be compared to the shrieking of the steam-pipes of many steamers blowing off. There is another geyser known as "Old Faithful," because it plays regularly every three-quarters of an hour. It throws a column to a height of from 100 to 150 feet, but though a fine geyser, it is not to be compared to the "Castle."

The "Giant" will play for an hour and twenty minutes, all the time throwing up a column of water to the height of 110 feet. There are numerous others, but as they are all similar in kind, though not in degree, we may omit noticing them by name. The borders of the Fire Hole River, and its confluent Iron Spring Creek, and a great part of the plain enclosed by these two streams, "are dotted in all directions by mud ponds, solfataras, fumaroles, warm pools, boiling springs, and the remains of many extinct geysers of considerable size." The still, deep, quiet wells are very lovely. They are circular basins fifteen or twenty feet across, and fifteen to sixty feet in depth, filled with exquisitely transparent water. The ground which surrounds these basins slopes very "gently back from the brink by an inch to three or four inches in height at a time. The edges of these steps are carved into a series of semi-arches, and adorned with mouldings of pearly heads, ranging in colour from a dull white to a coral pink. The rim of the basin is convoluted and gathered in, into a system of irregular curves, scalloped and beaded. The interior is of a most delicately rich cream colour, intensified in places to rose; and over portions of it is spread a fine network of lace-like fabric. Deeper down the ornamentation becomes larger, and the sides are composed of rounded sponge-like masses. The basin is filled to the brim with water, more transparent than anything you can imagine, and deeply blue. As the sun, rising or sinking, strikes at a greater or smaller angle the surface of the water, its rays, refracted more or less obliquely by the revolving element, give a constantly varying, but ever lustrous, appearance to the interior ornamentation and colouring of the pool, that baffles all attempts at description. One never tires of looking at these fairy lakes, for though language fails to convey the impression of variety, and the character of sameness would appear to be inseparable from them, yet it is not so at all; on the contrary, a constant and beautiful change is going on at every succeeding moment of the day."

With this notice of one of the many wonders of "Wonderland," we leave at once Wyoming and the Rocky Mountains—a range the name of which conveys so little meaning to those who live under its shadow—the Rocky Mountains being in reality a vague term for the many separate ranges, which together extend through the whole length of North America. Five or six years ago this interesting region was unknown, except by the dubious tales brought to the white settlements by Indians and trappers. Even yet we know little about it. A few parties visit it from Virginia City and come out at Bozeman; but they go in each other's footsteps, examine the same objects, and halt at the same places. Yet doubtless to those who have enterprise or time to stray from the usual route, there are in "Wonderland," to use the language of the only Englishman who has given detailed descriptions of it, "hundreds of valleys into which no human foot has ever burst, thousands of square miles of forest whose depth has never yet been penetrated by the eye of man." A large hotel, however, has been built in the most interesting portion of this "National Park" (which is under the control of a superintendent), and now that the North Pacific Railroad enables the country to be visited with ease, it is the holiday haunt of yearly increasing numbers.

CHAPTER VI.

THE MISSISSIPPI BASIN: NEBRASKA; MINNESOTA; IOWA; KANSAS; WISCONSIN; ILLINOIS.

IN a work of this nature it would be scarcely possible to fix a strictly natural arrangement of the regions to be described, and it would be still more difficult to keep accurately to that arrangement if once made. Accordingly, we have described as Rocky Mountain States some which should come, strictly speaking, under the head of the Mississippi Basin. But other reasons, already explained, have decided us to depart now and then from what physical geography might strictly demand. However, we have now altogether bidden farewell to the Divide of Waters. We enter the region drained by the Mississippi River and its tributaries, some of which are as large, if not larger, than the river into which they flow. But it has always been a moot question where a tributary ends and the river of which it is a feeder begins; and so we shall see it is in the Mississippi Basin. The Gallatin, the Madison, and the Jefferson, after each short separate course, unite and become the Missouri, which, according to the song, "rolls down to the sea." Undoubtedly it does; but there are the great falls, which at a distance of 2,540 miles from the Mississippi interrupt all navigation. Even there it carries a volume of water three or four times greater than the Thames at Richmond. It is sometimes only 300 yards wide, at other times it spreads from bank to bank over a distance of a quarter of a mile. After flowing for one hundred and twenty miles through a wild and savage country, it is joined by the Marias, and then, suddenly turning to the east, forms the "Great Bend." It now passes through the Judith Basin, a country full of buffalo and other game; then, after flowing easterly for about 250 miles, it is swelled by the Milk River from the north-west; a little further down it is joined by the Yellowstone, which flows out of the beautiful lake of that name (p. 89). Yet, strange to say, though we have been journeying southward, the climate has not been improving. Indeed, in winter the Indians, when travelling from the neighbourhood of Fort Buford and the Lower Yellowstone, are frequently compelled to use their snow-shoes till they get near the spurs of the hills, where not a vestige of snow is to be seen. They are then, owing to the warm radiating masses of the mountains, and probably the soft breezes from the Pacific also, able to hide their raquets, and pursue the journey on unnumbered feet.* From the rolling prairies, the home of the bison, and the vast solitudes of the Dakotas or Sioux, we have been entering a dismal, most peculiar region of brown flats, only allowing of the growth of a few cacti and sage brush shrubs. The river banks are no longer picturesque. The waters wash against brown clay, and the Missouri, literally the "Mud River," gets muddier and yellower every hour. "Nothing breaks the meaningless stupidity of the round, plain, flat, sad-coloured grey or olive-green, bounded by blue walls of sky. Not a single bit of bright colour, no object of beauty, not a shade even of pleasant verdure, refresh the tired eye. Everywhere is brown mud, grey clay, or white alkali; everything is

* "The Great Divide," p. 303.

VIEW ON THE UPPER MISSISSIPPI, MINNESOTA.

graceless, hideous, depressing." A startled Indian drinking at the river tells us that we are in the country of the Blackfeet and Minneconjou Sioux—their near relatives—Ishmaels in whose presence no man's cattle are safe, and no man's scalp sacred. We are passing through the *mauvais terre*, the Bad Land of the Dakotas, "a desert of clay, alkali, and sage brush, uninhabited and uninhabitable." Still we follow the river through the Coteau du Prairie, a plateau 1,800 to 2,000 feet in height, on through the Indian's land. But now pine-trees appear floating on its yellow waters (pp. 76, 104), and as the current swells with the contributions which the Big Cheyenne, the Niobrara, and a score of lesser tributaries pour into it, we emerge from utter savagedom into semi-barbarism. Indians are still the chief people we see on the banks, but they are Indians glossed with civilisation—they are red men in white men's clothes. We are passing through the Tetons and Yankton Sioux's country. East of this region is the Red Pipe Stone Quarry, famous in Indian song and story as the place where from time immemorial the Indians obtained the material out of which their calumets were fashioned, and where, accordingly, they met for the time being in mutual peace. Among the sand-hills that fringes the western banks marauding parties of Sioux, Brulés, Ogallalas, Pawnees, Ojéws, Winnebagoes (p. 109), and Omahas may be found warring amongst each other, but ready at any time to rob the whites. They are Indians who have lost whatever virtues they once possessed, and by contact with civilisation have imbibed everything that is bad, but little that is good, in the white men. Steamers are now numerous, and just before the shallow broad waters of the Platte pour in their sandy yellow tribute, the river sweeps between the rival "cities" of Omaha and Council Bluffs, the latter once famous in the annals of the West as the rendezvous of trappers and the "jumping-off place" of explorers bound for the then mysterious region. Then comes barbarism again. We are now going through the Indian territory, that tract set apart for the children of the soil who, amid torrents of blood and wrong unspeakable, have been removed from their ancient homes to this region. Soon after, according to geographers, we should be leaving the Missouri. But long below its junction with the clear Mississippi (pp. 81, 101) the river has been changing its appearance. It now imparts its muddy character to the Mississippi. It is, moreover, the largest stream, and drains the greatest extent of country, and should, therefore, still be called the Missouri. But fate has decided otherwise; and soon after leaving the once important, and still quaint French settlement of St. Charles, we glide into the shadow of the huge arches of the St. Louis Bridge, and step ashore in the queen city of the West (p. 117). "What a change," writes Lord Dunraven, to whose graphic pictures we are indebted for much of the preceding sketch. "What a change has taken place! Can this turbid, sullen flood, reeking with the filth of cities, and rushing sulkily through the arches, frothing on its slimy banks, torn and beaten by the paddles of countless steamers, be the same stream that leaped into life in the Northern Sierras, and, sweet with 'the odour of the forest, with the dew and damp of meadows, with the curling smoke of wigwams,' rushed through its 'palisade of pine-trees?' How utterly incongruous and out of place do we appear, and our little birch-bark canoe, in this busy hive of men, this great city of 300,000 [now nearer 400,000] inhabitants! What do the men who jostle and stare at us know of the far-away life of the prairie and the woods, though in their warehouses are stored thousands and thousands

of buffalo robes and skins? The best thing we can do is to get out of our mocassins, buckskins, and flannels, and with the help of the barber and the dry-goods store, transform ourselves into civilised beings in white shirts, black store clothes, and plug hat. How horribly uncomfortable we shall feel! How red and weather-beaten our faces will appear! And as to our hands—well, the less said about them the better.”

Taking, then, the Missouri as a part of it, the Mississippi is the longest river in the world, excepting, perhaps, the Nile. It is literally the *Miche Sepe*—the “Great Water.” It drains a region nearly half the size of Europe from its source in Lake Itasca—the *Lac la Biche* of the French, 1,680 feet above the sea—until it falls by many mouths into the Gulf of Mexico. From the mouth of the Missouri to the gulf it is 1,286 miles long; from its head waters to its mouth 2,908 miles, or from the Gulf of Mexico to the sources of the Missouri about 4,200 miles. Its numerous tributaries, many of them large rivers, drain all the States and Territories between the Rocky and Alleghany Mountains, and constitute a natural system of waterways, having an aggregate extent of 1,500 miles. The following table shows the names of the chief of these tributaries, the area of their basins, the rainfall, annual discharge, and ratio between drainage and rainfall: *—

Basin.	Area in Square Miles.	Annual Downfall in Cubic Feet.	Annual Drainage in Cubic Feet.	Ratio.
Ohio River	214,000	20,700,000,000,000	5,000,000,000,000	0.24
Missouri River . . .	518,000	25,200,000,000,000	3,780,000,000,000	0.15
Upper Mississippi . .	169,000	13,800,000,000,000	3,300,000,000,000	0.24
Small tributaries . .	32,100	3,600,000,000,000	3,210,000,000,000	0.90
Arkansas and White River }	189,000	13,000,000,000,000	2,000,000,000,000	0.15
Red River	97,000	8,800,000,000,000	1,800,000,000,000	0.20
Yazoo River	13,850	1,500,000,000,000	1,350,000,000,000	0.90
St. Francis River . .	10,500	1,100,000,000,000	9,900,000,000,000	0.90
Entire Mississippi, exclusive of Red River }	1,147,000	78,900,000,000,000	18,900,000,000,000	0.25

“Below the mouth of Red River,” writes Mr. Hawes, “the Mississippi is divided into numerous arms and passes, each of which pursues an independent course to the gulf. The highest of these is the Atchafalaya on the west side of the river. Below its point of separation from the Mississippi, the region of swampy lands of bayous and creeks is known as the delta. Above this the alluvial plain of the river extends to the Chains, thirty miles above the mouth of the Ohio, and to Cape Girardeau in Missouri, where precipitous rocky banks are first met with. These are the Lower Secondary Limestone strata lying in a nearly horizontal position. The total length of the plain from the mouth of the Ohio to the gulf is estimated at 500 miles. Its breadth at the upper extremity varies from thirty to fifty miles; at Memphis it is about thirty miles, and at the mouth of the White River eighty miles. The extreme width of the delta is rated at 150 miles, its average breadth is probably ninety miles, and its area 12,300 square miles. The

* Humphrey's and Abbot's “Report on the Hydraulics of the Mississippi River” (1861).

elevation of the bottom lands at Cairo above the sea level is about 310 feet, while the slope of the high water surface from that place to the gulf is from 322 feet to 0. These bottom lands are subject to inundations and consequent annual enrichment. Under the system of slave labour, large plantations were cut out of the dense forests which cover them, but vast tracts of unsurpassed fertility are yet covered with canebrakes and eypresses. The alluvial plain extending from above Cairo to the gulf is terminated in the east and west by a line of bluffs of irregular height and direction, composed of strata of the Eocene and Later Tertiary formations. Down this plain the river flows in a

RAFTS OF TREES ON THE MISSOURI.

serpentine course, frequently washing the base of the hills, on the east side, as at Columbus, Randolph, Memphis, Vicksburg, Grand Gulf, Natchez, and Baton Rouge, and once passing to the opposite side at Helena. The actual length of the river from the mouth of the Ohio to the gulf is 1,097 miles, increasing the distance in a straight line by about 600 miles, and by its flexures also reducing the rate of its descent to less than half the inclination of the plain down which it flows. The range between high and low water at Cairo, near the head of the plain, is 51 feet, and at New Orleans it is 14.4 feet. The river flows in a trough about 4,470 feet wide at the head, and 3,000 feet at the foot. The immense curves of the stream in its course through the alluvial plain sweep around in half circles, and the river, sometimes, after traversing twenty-five or thirty miles, is brought within a mile or less of the place it had before passed. In heavy floods the water occasionally bursts through the tongue of land, and forms what is called a 'cut off,' which may become a new and permanent channel. The height of the banks and the great depth of the river bed check the frequent formation of these

cut offs, and attempts to produce them artificially have often failed, especially when the soil is a tough blue clay, which is not readily worn away by the flowing water. This was the case at Bayou Sara, when in 1815 an excavation, intended to turn the river, was made, by which a circuit of twenty-five miles would have been reduced to a cut off of one mile; and also at Vicksburg in 1862-1863, when the Union army endeavoured to make a cut off out of range of the Confederate guns. Semicircular lakes, which are deserted river bends, are scattered over the alluvial tract. These are inhabited by alli-

VIEW OF THE SOURCE OF THE ARKANSAS, ONE OF THE TRIBUTARIES OF THE MISSISSIPPI.

gators, wild fowl, and garfish, which the steamboats have nearly driven away from the main river. At high water the river overflows into these lakes. The low country around is then entirely submerged, and extensive seas spread out on either side, the river itself being marked by the clear, broad band of water in the midst of the forests that appear above it." One social result of this overflow has been referred to already (p. 86).

During the spring freshets, the river often undermines the banks, and the current is then often so strong that steamboats are sometimes swept into the bayous in the forest beyond. The lower portion of the delta is often not over a few inches above the level of the surrounding waters, and in no place more than ten feet. The delta extends far into the Gulf of Mexico, and year by year is increasing, owing to the

immense quantity of fine mud brought down by the river. Humphrey and Abbot calculated that more than 812,500,000,000 lbs. of sedimentary matter, constituting one square mile of deposit 263 feet in height, are every year carried down to the Gulf of Mexico by this great river. This, however, only refers to the sediment in suspension. In addition to this the current pushes on before it large quantities of earthy matter—calculated at about 750,000,000 cubic feet, which would every year cover a square mile about twenty-seven feet deep. The uniform width of the Mississippi is one of the curious features in connection with it. At New Orleans it is 3,000 feet wide, and it maintains pretty much the same breadth for 2,000 miles, except in the bends, where it swells out to one or even one mile and a half. The depth is, however, very variable—the maximum being usually about 120 or 130 feet. The great impediment to its navigation, as to the navigation of all other American rivers, is often the shoals, the rafts, and trees brought down by the freshets. Sometimes these will block up the course or get fixed in the mud, or swing backwards and forwards. In the one case the tree is known as a “Snag,” and in the other a “Sawyer.” Both are dangerous obstacles to navigation, and frequently damage the fragile steamers. These are, however, usually built in air-tight compartments, so that if a hole is knocked in the bows the water only fills a portion of the vessel, and does not therefore sink it. The greatest drift in the Mississippi was that which began to accumulate about the year 1778 in the Atchafalaya, until in 1816 it had extended to more than ten miles in length, over 600 feet in width, and about eight feet in depth. This great accumulation rose and fell with the water, but, nevertheless, it afforded a soil for the growth of bushes and trees, some of which attained the height of sixty feet. In 1835 the work of removing it commenced, and the costly task was accomplished in four years. The Red River raft is even more famous, not only for its size—it was thirty miles long—but for the sums of money which have been spent by the Federal Government in attempting to remove it. Up to a late date this amounted to 7,789,840 dollars, and the raft had not then entirely disappeared. The “Lower Mississippi” properly begins where the Missouri, so-called, joins; but the name is not usually applied until the river has crossed the “rocky chain” (p. 103), which extends across the channel between St. Louis and Cairo. All below this “chain” in the Mississippi Valley is alluvium, through which the river winds along from bluff to bluff. “Touching these bluffs at Commerce, Missouri, on the west bank,” writes Mr. King, one of the students of this changeable flood, “it courses across the valley, passing the vast prairies of Lower Illinois, known as ‘Egypt,’ on the east, meets the Ohio at Cairo, then strikes the bluffs again at Columbus, on the eastern or Kentucky shore. It skirts these bluffs as far as Memphis, having on its west the broad earthquake lands of Missouri and Arkansas. It then once more crosses its valley to meet the waters of the White and Arkansas Rivers, and skirts the bluffs at Helena in Arkansas, flanking and hemming in the St. Francis, with her swamps and sunk lands. Reinforced by the White and Arkansas, it again crosses its valley to meet the Yazoo, near Vicksburg, creating the immense Yazoo Reservoir on the east bank, extending from the vicinity of Memphis to Vicksburg, and the valleys and swamps of the Macon and Tensas on the west side. These latter have no terminus, save at the Gulf of Mexico, as the river does not approach the Western Bluffs after leaving Helena. From Vicksburg to Baton Rouge

the river hugs the Eastern Bluffs, and from Baton Rouge to the mouth, the pure 'delta country,' for a distance of more than 200 miles."*

The Mississippi and the people, and their cities and villages on its banks, would afford ample material for many volumes. But with these introductory remarks we must now say a few words about the political divisions of the country on either side of it; in other words, about the States and Territories of the Mississippi Valley proper.

NEBRASKA.

The State of Nebraska has an area of 76,617 square miles, and is divided into sixty-five counties, most of which are settled by a farming population, extending in width from north to south about 208½ miles, while the length in the central portion is about 413 miles. Lincoln, the capital, had, in 1870, 2,411 inhabitants, and in 1883 about 16,000. Omaha (p. 88) is, however, the chief city, having 31,000 inhabitants in 1880; then comes Nebraska City, with 4,200 (in 1880). The total population of the State, exclusive of Indians not taxed, was, in 1880, 452,402, including 419,764 white, and 2,638 "coloured" and tame Indians. There were 219,241 males, and 203,161 females, 352,113 of native, and 97,351 of foreign birth, one-third of these being Germans. In 1880 the percentage of deaths to the population was only 0.81 per cent. In 1873 there were 6,579 Indians in Nebraska on reservations comprising 892,800 acres, and by the Commissioners' Report of 1882, 4,939. These comprise Santee Sioux, Poncas, Winnebagoes (p. 109), Omahas, and a few other broken tribes. The general surface of the country is nearly a great plain, rising by a gradual slope from the Missouri to the Rocky Mountains. The prairies, of which the State chiefly consists, are either undulating or broken into low hills and ridges. There are, however, no hills of any magnitude, except at the west and north-west, where the Black Hills and Rocky Mountains make their appearance. There are no large lakes, but many streams, none of which are navigable except the Missouri, which forms the N.E. and E. boundary of the State. The Platte is a wide but shallow river, and passes through a very fertile valley. The country is not rich in minerals. Iron and coal have been found, but neither in great abundance. Saline deposits and alum are, however, more plentiful. The eastern portion of the country is a good agricultural region, but the west is better adapted for grazing purposes. Large numbers of cattle fatten on the nutritious natural grasses of Nebraska, while numbers of sheep are kept on the luxurious pastures of the bottom and table-lands. Wood of a natural growth only flourishes on the bluffs and river banks, but planted trees grow rapidly on the prairie. The climate is "dry and exhilarating," the mean temperature in winter being about 22°, and in summer 70°. Of the total area of the State (49,054,080 acres) 5,504,702 acres were in 1880 in "improved farms." These numbered 63,387, of which 355 embraced less than ten acres each, and only 666 from 500 to 1,000 acres. The greatest number of farmers had from 100 to 500 acres of land. The assessed valuation of the State was, in 1882, 96,537,475 dollars, which is, however, only one-third of the real value of the taxable property. Nebraska is noted for the

* "The Southern States" (1875), p. 262.

liberality of its laws, and more especially for the full exercise of "women's rights" to the fullest extent. Any property which a woman may possess at the time of her marriage, or which she may acquire by her own exertions afterwards, is free from the control of her husband, and not subject to his debts. A married woman may convey her estate, and in every contract or business transaction is treated in the eye of the law exactly as an unmarried woman. She can plead for a divorce on almost any reasonable, and a few perfectly unreasonable, ground. In addition to the usual pleas allowable

VIEW IN NEBRASKA.

in most civilised countries, the Nebraska wife can claim to have the marriage knot untied if her husband has been sentenced to imprisonment for three years or more, if he is an habitual drunkard, if he has deserted her for two years, if he is "extremely cruel"—in fact, if he does anything inimical to the wife's good pleasure.

MINNESOTA.

Minnesota was the nineteenth State admitted into the American Union, and is the twenty-eighth in point of population. Its extreme length, from north to south, is 380 miles; its

breadth, from 183 miles in the middle to 262 miles on the south line, and 337 miles near the northern boundary; while its area is 83,365 square miles. St. Paul's, the capital, near the eastern border of the State, had, in 1880, 11,473 inhabitants. At that date the other chief towns were Duluth, Hastings, Owatonna, St. Cloud, Rochester, and Mankato, none of which had 6,000 people; Minneapolis, which had nearly 47,000; Winona, with over 10,000; Red Wing, with more than 6,000; and Stillwater, with over 9,000. In

WINNEBAGO INDIAN.

1880 the whole population of the State was found to be 780,773, of whom 107,770 were born in Norway and in Sweden, and 77,505 in Germany, while about 68,277 were natives of Great Britain. The density of the population was 8.50 to a mile. Over 131,535 of the entire working people are engaged in agriculture, including 34,000 labourers and 97,000 farmers and planters. The death average is about 1.035 of the whole population. In 1880 17,803 Indians were reported in Minnesota; these consisted of tribes which were settled on reservations in the central and northern parts of the State, and for the most part engaged in agriculture. Minnesota lies nearly in the

centre of the Continent, and occupies the most elevated plateau between the Gulf of Mexico and Hudson's Bay. It thus forms the watershed of the three great river systems of Eastern North America—that of the Mississippi, that of the St. Lawrence, and that of the Red River of the north. Generally the surface is an undulating plain, with an average elevation of 1,000 feet above the sea, and “presents a succession of small rolling prairies or table-lands, studded with lakes and groves, and alternating with belts of timber.” There is no coal in the State, but lead exists, and copper abounds in the mineral belt stretching along the north shore of Lake Superior, chiefly in the form of the virgin metal. Iron of good quality is also found in some places, while, as if to compensate for the want of fuel of other kind, great deposits of peat exist in all parts of the State. Salt springs are found; slate, limestone, &c., are mined; while gold and silver have been discovered, though in small quantities. The soil is fertile, two-thirds of it being well adapted for the growth of all kinds of cereals and roots of the temperate zone. The climate is pleasant: cold, but clear and dry, during the winter, with no great amount of snow; while the summers are warm, with breezy nights, during which time most of the rain falls above lat. 46°. The country is well timbered, pine forests extending to the north, and birch, aspen, ash, and maple abound. Over the central portion of the State a great forest, known as “The Bigwoods,” composed for the most part of hard-wood trees, extends. These Bigwoods—the *Bois Franc* of the early French settlers—cover an area of about 4,000 square miles. “Many objects of natural interest,” writes Mr. Hawes, “are found in the State. The Mississippi, studded with islands and bordered by high bluffs, presents a succession of picturesque scenes (pp. 81, 101). Mountain Island, with an elevation of 428 feet; Maiden's Rock, celebrated in Indian tradition, on an expansion of the river called Lake Pepin, about 400 feet high; and La Grange Mountain, on the same lake, are all notable. St. Anthony's Falls, celebrated as much for their surrounding scenery as for the descent of the waters, which have a perpendicular fall of only eighteen feet, are further up the river. A few miles beyond, between Minneapolis and Fort Snelling, are the Minnehaha Falls, a romantic and beautiful cascade, with a perpendicular pitch of forty-five feet, flowing over a projecting rock, which permits a passage underneath; Brown's Falls, which have a perpendicular descent of fifty feet, and including the rapids of 100 feet, are west of the Mississippi, on a narrow stream, which is the outlet of several small lakes. There are also falls or rapids on the St. Croix, about half a mile below which is a noted pass, through which the river has forced its way, called the Dalles of St. Croix, and others of less note on various streams. About two miles from St. Paul's is Fountain Cave, an excavation in the white sandstone, with an entrance about fifteen feet in diameter, opening into a chamber 150 feet long and twenty feet wide.” It is as an agricultural State that Minnesota must be considered; as a manufacturing region it ranks low. However, the abundant supply of water-power, which is found everywhere throughout the State, will eventually lead to its industrial prosperity. St. Anthony's Falls are estimated as being equal to 100,000 horse-power, capable of being utilised through nearly the entire year; and as sentiment does not usually form a marked feature in the character of the Western settler, there can be little doubt that in time this beautiful feature in the scenery of the State will be utilised for such a prosaic purpose even more so than at present.

Though, as has just been mentioned, the Philistinish eyes of the searchers after "water-power" have half spoilt these beautiful cascades, the Falls of St. Anthony are perhaps the most remarkable natural feature of Minnesota. A view of them will be seen in Plate XIV. They are situated about an hour from St. Paul's, and are now a great place of resort for visitors to the West, and deservedly so. They are by no means the finest of the cataracts of the American rivers, but still they have a wild picturesque grandeur almost their own. One can understand the enthusiasm of Père Hennepin, who was so carried away with admiration when he first saw them, that he named them after his patron saint. Even the stolid Indian has perceived the beauty of them. In the Dakota language they are *Rara*—from "irara," to laugh—a name which may be partially translated as the "laughing waters." Long before coming in sight of them the ear hears the deep solemn roar, "the sound of many waters." When they burst into view the appropriateness of the aboriginal name at once strikes us. They are indeed the "laughing waters." They have not the overwhelming grandeur of the Niagara, nor the same height of fall, deafening roar, or lofty character of the scenery. St. Anthony's are more within the grasp of human comprehension, and therefore, as one of the earliest visitors to them remarked, looked upon with more real pleasure. Niagara appears to wear a kind of threatening frown, while St. Anthony greets the pilgrim to its base with a more winning and complacent smile. Yet, on account of the vast body of water continually rushing over the rocky mass in the river's bed, the scene is one of profound sublimity, as well as of beauty and loveliness.* Lumbering is also another great occupation of the State, one-third of the State being estimated as timber land. The total taxable property in the State was, in 1882, valued at 750,000,000 dollars. Educational and other advantages are abundant.

IOWA.

This State presents an area of 55,045 square miles. North and south it extends 208 miles, and east and west about 300. The largest cities in 1880 were Burlington, with (in round numbers) 20,000 inhabitants; Davenport, with 22,000; Dubuque, with 23,000; and Des Moines, the capital, with 23,000. The whole population of the State was, in 1880, 621,620, including three hundred tribal Indians. Diseases of the lungs and chest are very fatal throughout this State, whooping-cough showing a higher mortality than in any other State, except Nebraska and Arkansas. Iowa has usually an undulating surface. There are no mountains, or even high hills, but on the banks of the rivers there are frequent bluffs or calcareous strata, intersected by ravines. These bluffs are the breastworks of table-lands that stretch away from behind them in gentle undulations. The southern portion of the State excels in picturesqueness, abounding with grassy lawns and verdant plains, interspersed with groves and meandering rivulets, and intersected by the larger rivers which flow to the Mississippi, or by the numerous affluents of the Missouri. In

* Bond: "Minnesota and its Resources," p. 150.

the north-eastern part the surface is more elevated; hills and mounds are not uncommon, their tops covered with towering oaks, and the rivers tumble over precipitous ledges of craggy rocks. The north-east section abounds in lead ore, and various other metals, but, nevertheless, contains much excellent land. The unique and admirably-diversified prairies of Iowa are, however, its most distinguishing feature. These natural meadows are covered with a rich coating of coarse grass, forming excellent pasturage, and are not unfrequently interspersed with hazel thickets and fragrant shrubs, and in the season of flowers are decorated with a brilliant garniture of honeysuckles, jessamines, wild roses, and violets.* Iowa is essentially an agricultural State. According to the census of 1880 it produced more maize or Indian corn than any of the States, except Illinois, and ranked fifth in the production of wheat. The State at that date contained 19,866,541 acres of improved land, 755,290 of woodland, and 2,130,869 "of other unimproved land." About one-eighth of the farms contained from twenty to fifty acres, over 58,519 from 50 to 100, 95,163 from 100 to 500, 2,298 from 500 to 1,000, and only 364 over 1,000. In 1872 the number of acres of "improved land" was 9,987,788. In 1880 the total taxable value of the State property was 397,522,764 dollars; the State taxes yielded 827,305 dollars (the public debt being 3,477,000 dollars), while the rest, including the county hospital for the insane, county school, district school, bridge, road, special, judgment and bond, corporation, and railroad, brought the entire revenue up to 11,061,605 dollars.

KANSAS.

This State owes its name to the Kansas Indians, a sept of the Dakota family. It is in the form of a rectangle, extending east and west 400 miles, and north and south about 210 miles, the whole area containing 81,318 square miles. Its chief cities are Atchison, 15,106 inhabitants; Leavenworth, 17,000; Lawrence, 8,600; and Topeka, the capital, which in 1880 had 15,451 people within its borders. In 1880 it was calculated that in the entire State there were 995,966 inhabitants, showing a density of population represented by twelve persons to the square mile. The general surface of the State is an undulating plateau, sloping gently from the western to the eastern border, which is not elevated more than 750 feet above the sea at the mouth of the Kansas River. The river bottoms are generally from one-fourth of a mile to three miles wide; but towards the western part of this State, on the Arkansas and Republican rivers, they are from two to ten miles wide. Back from the bottom lands bluffs run to the height of from 50 to 300 feet, with a slope of 20° to 30°. From the summits of these bluffs may be seen a succession of rolling or upland prairies, whose tops are from a quarter of a mile to a mile apart, and from twenty to eighty feet above the intervening valley. The gentle inclination of the ridge is north and south. There is no portion of the State which is flat or monotonous. The surface of Eastern Kansas is chiefly undulating, and presents a succession of rich prairies, grass-covered hills, and fertile valleys, with an abundance

* See also Hall and Whitney: "Geological Survey of Iowa" (1858-59); White: "Geological Survey Reports" (1872).

of timber on the streams. The western half is not so diversified in its scenery, but it has a rolling and varied surface, with every requisite for a fine grazing country.

VIEW OF "THE PITCHED ROCKS," SOUTHERN SHORE OF LAKE SUPERIOR.

The soil is favourable to agriculture, Indian corn, potatoes, and barley being raised in abundance, while the natural grass of the western portion of the State affords excellent

fodder for cattle. Coal, lead, salt, and stone are plentiful; while oak, elm, black walnut, honey-loenst, willow, hickory, syeamore, white ash, and hackberry abound. The buffalo, elk, deer, antelope, squirrel, quail, hares, prairie dog (p. 44), grouse, wild turkey, wild geese, and other game, once common, have now either vanished or become scarce. According to the census of 1880, 21,417,468 acres were in farms, while over 10,739,000 acres were "improved." The people are chiefly devoted to agriculture, and stock-rearing, and fruit-growing. There is comparatively little manufacturing industry, though in time the water-power of the State will increase the mills and foundries. In 1880 the total taxable property was returned as worth 160,891,689 dollars, and the tax actually levied amounted to a total of 4,979,650 dollars. The laws of Kansas, like those of most Western States, are extremely favourable to woman. Her pre-marital property is protected, subject entirely to her own control. Neither husband nor wife can bequeath more than one-half of his or her property without the written consent of the other. Divorees may be granted by the district courts for, among other causes, abandonment for a year, drunkenness, cruelty, gross neglect, and imprisonment in the penitentiary subsequent to marriage. Kansas, being one of the border slave States, was long one of the battle-fields of the *pro* and *contra* slavery parties. Finally it adopted the free state principle; and though it suffered greatly during the Civil War, remained loyal to the Federal Government.*

WISCONSIN.

OF Wisconsin, or Ouisconsin, a few words may suffice to give an idea. In length it is 285 miles long from north to south, 255 broad, and its area 53,924 square miles, or 34,511,360 acres, of which 9,162,528 acres are improved land. In 1880 its population was 1,315,497. The surface of the State consists of rolling table-lands; the streams or the watershed between the Mississippi and Lake Superior having falls and rapids. Our friend, the late lamented Dr. Bryce, to whom we are indebted for these notes, remarks that two other ridges cross the State—one in the south-west near the middle, and the other in the south-east, dividing the waters which enter Green Bay from those flowing direct to Lake Michigan. Near the base of the second ridge there is a depression across the State in the line of the Fox River and Lake Winnebago and lower course of the Wisconsin, so that the headwaters of the former come near the Great Bend of the latter. In a very wet season, or on the sudden melting of the snow, the intervening plain near Portage City becomes flooded, and a natural connection is established between the Mississippi and Lake Michigan. Advantage has been taken of this singular feature to maintain a constant connection by means of a canal. Thus, a vessel can pass up the Mississippi into the Lakes, and thence by the St. Lawrence into the Atlantic. Wisconsin is a poor agricultural State. The climate is severe and the soil bad, though towards the south it improves, and supports good crops and excellent pasture. Iron, zinc, lead—the latter in great abundance—are mined; plumbago, saltpetre, gypsum, and fine marl also occur, while the Illinois fields enter the State on the south. The neighbouring lakes, the Mississippi, the Chippewa, and Black Rivers, afford great natural facilities for carriage. Hence the trade of the State is very prosperous; and, in addition to the above, gives employment to

* Hutchinson: "Resources of Kansas" (Topeka, 1871).

about 2,960 miles of railway. The amount of wheat—grown chiefly in the park-like southern prairies—was, in 1880, estimated at 17,321,141 bushels, but this is small compared with the 106,000,000 bushels of maize “raised” in the same region. Among the more interesting features of Wisconsin may be mentioned the earthworks in the form of men and animals formed by the same prehistoric race who mined the copper of Lake Superior; the Devil’s Lake, 600 acres in extent, on the summit of a mound 300 feet high; the precipitous shores of Lake Pepin, rising to the height of 500 feet; the high bluffs of the Mississippi and Wisconsin Rivers; the falls of St. Louis (320 feet in sixteen miles); and of the Menomonee, (131 feet in one and a half miles); the wild cliffs of Lake Superior, the beauty of which culminates at “The Pictured Rocks” (p. 113), on the shores of Michigan, &c.

ILLINOIS.

This State takes its name from the Illinois tribe of Indians, members of the Alouquin family. It was the eighth admitted into the Union, and is now the fourth in population. It has an area of 55,414 square miles, and had a population, in 1880, of over 3,080,800 whites, and 46,500 “coloured.” Springfield, which possessed at that date a population of 20,000, is the capital, but Bloomington, Joliet, Cairo (said to be the “Eden” of “Martin Chuzzlewit”), Rockford, Aurora, Rock Island, Belleville, and Jacksonville, are all considerable towns, while Peoria, Quincy, and, above all, Chicago (which had, in 1880, more than 504,000 people), are larger than the capital. Next to Louisiana and Delaware, Illinois is the flattest State in the Union. Its greatest elevation is 1,150 feet, and its mean elevation about 550 feet above tide-water. Accordingly, though lead, coal, and other mines are worked in the State, agriculture and manufactures are still its greatest industries. “In every part of the State the plough may pass over thousands of acres without meeting even so much as a pebble to impede its course.” Timber is, however, abundant, but is unequally distributed—whole districts being bare. The climate, though in most places healthy—except in the low-lands near the river—is excessively cold in the winter, and unusually hot in the summer. Pleasant breezes, however, modify the heat, so that the climate is not so unfavourable for out-of-doors labour. Illinois, in 1880, showed a return of more acres under cultivation than any other State, and its yield of wheat, Indian corn, and oats was also the highest. The total number of farms was 255,711, 46,594 of which were from twenty to fifty acres, 76,080 from 50 to 100, 116,562 from 100 to 500, and 649 containing 1,000 acres and over. According to the same census, Illinois ranked sixth in the amount of capital invested in manufactures and in the value of the products. Its products of butchering, distilling liquors, planing timber, and packing pork, brought it ahead of any other State of the Union. In 1880, some 2,000,000 pigs met death at the hands of the Illinoisians, the aggregate cost of the hogs being 17,000,000 dollars, and the total weight of the lard about 80,000,000 lbs. The total valuation of the State property was, in 1880, 786,616,394 dollars, and the receipts into the State treasury for the twelve months ending in 1880 were 2,712,626 dollars. The State debt diminished from 12,280,000 dollars in 1863 to 1,706,750 dollars in 1874, and in 1880 to nothing—a circumstance rather phenomenal in the history of these public luxuries.

CHAPTER VII.

THE UNITED STATES: MISSOURI; ARKANSAS; THE INDIAN TERRITORY; LOUISIANA.

IN this chapter we enter upon what used to be called the Slave States, and which, now that slavery is abolished in the great Republic, are usually comprised, with others yet to be spoken of, under the name of the Southern States. They have much in common, owing to the great preponderance of negroes in most of them, and the fact that they were for four years leagued together in a struggle—still fondly, or, it may be, bitterly, remembered as the “lost cause”—and by the fact that in many of them the population is of a different origin from that in the New England or the northern portions of the Union. We can most conveniently say what we can afford space for under the heads of the different States.

MISSOURI,

speaking of it simply as a geographical entity, is 277 miles long from north to south, and from 200 to 312 miles from east to west, with an area of 65,350 square miles, or 41,905,180 acres. Its chief towns are Jefferson City (the capital), St. Louis (p. 117), Kansas City, Hannibal, Independence, and St. Joseph. Its great rivers are the Mississippi, which forms its boundary for 470 miles, and the Missouri, which borders the State in the west for a certain distance, and, with its affluents, the Osage, Gasconade, &c., passes through it from west to east. South of the Missouri the State is undulating, rising into mountains towards the borders of Arkansas, while the north portion is level prairie-land, with rich bottoms, and lofty picturesque bluffs on the rivers. Coal, iron, lead, and limestone are abundant; but the severe winters and hot summers do not prevent the rich land from producing maize, wheat, hemp, tobacco, peaches, nectarines, grapes, &c. Cotton is grown in the southern portions; and the Germans, who have settled in the State in great numbers, have introduced wine-making. The manufactories of Missouri are chiefly ironworks, flour-mills, and breweries. St. Louis has a large trade, and now comprises upwards of 400,000 inhabitants, though in 1775 it was a French trading post, with only 800 people settled in the vicinity. The whole population of the State was, in 1870, 1,721,000, an increase in fifty years of 1,618,514. The population is now more than 2,200,000. Politically, Missouri is the child of a compromise, whose epitaph was written in letters of blood. During her early days the soil was disputed by Gaul and Indian, and afterwards by Frenchman and Spaniard. St. Louis, which was the centre whence the early explorers set out, experienced many vicissitudes. During the early days of the American Revolution it suffered from Indian raids, and the terrorism of the banditti who then haunted the Mississippi, until it began gradually to get acquainted with the gaunt American pioneers who floated into it on their way to the trapping-grounds of the mysterious West, and knew it as *Pain Court*—short bread—owing to their painful experience that in St. Louis provisions were not always to be had. The Osages were in those days ever hanging about the outskirts of the town, and many an unfortunate pioneer, in the years closing last century and beginning this, was

burned at the stake, impaled, or otherwise slowly tortured to death by the ruthless savages, whose name and appearance are now in the region which once knew them mere matters of tradition. In 1803 Missouri was formally surrendered to the United States, and with the advent of the Stars and Stripes the new territory and St. Louis took giant strides on the road to prosperity. "Looking down," writes Mr. King, "upon the St. Louis of to-day

VIEW OF ST. LOUIS, MISSOURI (1870).

from the high roof of the superb temple the Missourians have built to the mercurial god of insurance, one can hardly believe that the vast metropolis spread out before him represents the growth of only three-quarters of a century. The town seems as old as London. The smoke from the Illinois coal has tinged the walls a venerable brown, and the grouping of buildings is as picturesque and varied as that of a Continental city. From the water's edge, on ridge after ridge, rise acres of solidly-built houses, vast manufactories, magazines of commerce, long avenues bordered with splendid residences; a labyrinth of railways bewilder the eye, and the clang of machinery, and the whirl of a myriad wagon-wheels, rise to the ear. The levee is thronged with busy and uncouth labourers, dozens of white steamers

are shrieking their notes of arrival and departure, the ferries are choked with traffic; a gigantic and grotesque seramble for the almost limitless West beyond is spread out before one's vision. The town has leaped into a new life since the war, has doubled its population, its manufactures, and its ambition, and stands so fully abreast of its wonderful neighbour, Chicago, that the traditional acerbity of the reciprocal criticism for which both cities have so long been famous is latterly much enhanced. The city, which now stretches twelve miles along the ridges branching from the watershed between the Missouri, the Merrimae, and the Mississippi Rivers, flanked by rolling prairies, thickly studded with groves and vineyards; which has thirty railway lines pointed to its central depôts, and a mile and a half of steamboat at its levee, 1,000 miles from the sea; whose population has increased from 8,000 in 1835 to 351,000 in 1880; which has a banking capital of 19,000,000 dollars; which receives thousands of tons of iron ore monthly; has bridged the father of waters, and talks of controlling the cotton trade of Arkansas and Texas; is a giant in comparison with the infant settlement wherein, in a rude cottage, Colonel Stoddard had his head-quarters when the United States assumed territorial jurisdiction. In those days the houses were nearly all built of hewn logs, set up on end, and covered with coarse shingled roof. The town then extended along the line of what are known as Main or Second Streets. A little south of the square called the *Place d'Armes*, Fort St. Charles was held by a small garrison; and in the old stone tower, which the Spaniards had built, debtors and criminals were confined together. French customs and French gaiety prevailed. There were two diminutive taverns, whose rafters nightly rang to the tales of hairbreadth escapes told by the boatmen of the Mississippi. The Chouteaus, the Lisas, and the Labbadies were the principal merchants. French and English schools flourished. Pelts, lead, and whisky, were used as currency, and negroes were to be purchased for them. The semi-Indian garb of the trapper was seen at every street corner; and thousands of furs, stripped from the buffalo and the beaver, were exported to New Orleans. The mineral wealth lying within a hundred miles of St. Louis had hardly been dreamed of; the colonists were too busy in killing Indians and keeping order in the town to think of iron, lead, coal, and zinc. The compromise which gave the domain of Missouri to slavery checked the growth of the State until after it had passed through the ordeal of the war. How then it sprang up like a young lion, confident of the plenitude of its strength, all the world knows. St. Louis under free institutions has won more prosperity in ten years than under the old *régime* it would have attained in fifty."

There is now no more cosmopolitan city than St. Louis. "Conservatism" is a reproach, and "go-aheadishness" the order of the day. After the war, the difficulties of "reconstruction" troubled the Missourians little. The negro element was never great in the country. Accordingly, the 146,000 freed-men never constituted, as they have in other of the ex-slave States, an element of trouble; while the 533,000,000 dollars' worth of taxable property is quite well able to bear, and in time will clear itself of, the burdens imposed by the war.

The ferry across the Mississippi was at one time a great feature in St. Louis. Its approaches were crowded with a multitude of the most cosmopolitan and motley character. "There may be seen the German emigrant, flat-capped, and dressed in coarse black, with

his quaintly-attired wife and rosy children clinging to him; the tall and angular Texan drover, with his defiant glance at the primly-dressed cockneys around him; the 'poor white' from some far Southern State, with his rifle grasped in his leau hand, and his astonished stare at the extent of brick and stone walls beyond the river; the excursion party from the East, with its maps and guide-books, and its mountains of baggage; the little groups of English tourists, with their mysterious hampers and packages, bound towards Denver or Omaha; the tired and ill-uniformed company of troops 'on transfer' to some remote frontier fortress; the smart merchant in his carriage, with his elegantly-dressed negro driver standing by the restive horses; the hordes of over-clothed commercial men from the northern and western cities, with their mouths distended by Havana cigars, and filled with the slang of half a dozen capitals; and the hundreds of negroes who throng the levees in summer, departing in winter, like the swallows, at the slightest tinge of snow, or of the fog which from time to time heightens the resemblance of the Missouri capital to London. Before the bridge was built the levee on each side of the river was a kind of pandemonium. An unending procession of wagons, loaded with coal, was always forcing its way from the ferry-boats up the bank to the streets of St. Louis, the tatterdemalion drivers urging on the plunging and kicking mules with frantic shouts of 'Look at ye!' 'You dar!' These wagons on busy days were constantly surrounded by the incoming droves of wild Texan cattle, that, with great leaps and flourish of horns, objected to entering the gangways of the ferry, and uow and then tossed their tormentor high in the air; and by troops of swine bespattered with mud, and dabbled with blood drawn from them by the thrusts of the enraged horsemen pursuing them. Added to this indescribable tumult were the lumbering wagon trains laden with iron or copper, wearily making their way to the boats; the loungers about the curbstones singing rude plantation songs or senffling boisterously; the nameless ebb-tide of immigration scattered through a host of low and villainous bar-rooms and saloons, whose very entrance seemed suspicious; and the gangs of 'roustabouts' rolling boxes, barrels, hogsheds, and bales from wagon to wharf, and from wharf to wagon, from morning to night. Below the bridge, the river, gradually broadening out, was covered with coal-barges and steam-tugs, and above it, along the banks, one saw, as one still sees, dark masses of homely buildings, elevators, iron foundries, and various manufactories; while along the shore are moored thousands of logs, fastened together in rafts." The building of the bridge has changed much of this, though the crossing of the Mississippi is to this day a point at which a varied mass of men and manners run into a narrow space. Except in the names of the streets, little of the old French character in the town remains. On the Illinois side of the river still lingers the old village of Cahokia—a moss-grown relic of the past—its venerable Church of Notre Dame des Kahokias, the oldest building in the West, standing a strange monument of a decayed civilisation among the magnificent residences of the merchant-princes, whose hives are on the opposite shore.

The street-life of St. Louis is varied and interesting, and the endless auction-houses which here, as in most Western and Southern cities abound, is a curious feature of commercial life. From morning to midnight the doors of the establishments are open, and the jargon of the seller may be heard ringing out above the rattle of wheels, as the

tramway runs past his *locale*. "The genius who resides behind the counter," writes a visitor, "is usually some graduate of the commerce of the South. Accustomed to dealing with the ignorant and unsuspecting, his eloquence is a curious compound of insolence and pleading. He has a quaint stock of phrases, made up of the slang of the river and the shams of cities, and he begins by placing an extravagant price upon the article which he wishes to sell, and then decreasing its value until he brings it down to the range of his customers."

The Irish element in St. Louis keeps it lively in one sense, and the Germans impart animation to it from a pleasanter point of view. In even the fashionable sections of the city, ladies receive their friends seated in the porches and on the front doorsteps of their houses. On a summer evening hundreds of groups of ladies and gentlemen may be seen thus seated, behaving, however, towards each other with all the etiquette of the drawing-room. Society is, as may be imagined, exceedingly free and agreeable. The ladies especially, having in many cases been educated both in the East and West, have the culture of the former region, with the frank cordiality of the latter. Added to this, German manners prevail. In the summer evenings, the more fashionable beer-gardens may be seen crowded, not only with Teutonic, but with American families drinking lager beer and listening to the music, without—as they would in the Eastern and, indeed, in many of the Western States—regarding the custom as a dangerous "Dutch" innovation. The German migration began in 1830, but it was not until 1848, when the revolution set multitudes seeking a home across the Atlantic, that the best foreign element in the United States came in any great number. Since that year, however, multitudes of these have year after year arrived in America, and Missouri has ever been a favourite place of settlement for them. At the present moment it is calculated that, in St. Louis alone, there are more than sixty thousand of them, but, including children born in the city of German parents, the number must reach nearer 100,000. The Teutonic element, though an excellent drag on the more excitable American, and one which has kept the State from rushing into many excesses in the troublesome times preceding and during the war, is now fast merging into the American, though imparting to native society many of the heartier features of European life wanting among the austere New Englanders. In another generation or so, the fusion between the two races will be almost complete—thus giving "the Western people" features even more distinctive than they possess at present. In commerce, agriculture, literature, journalism—indeed, in every enterprise—the Germans are among the foremost; while in politics—a rôle for which they do not much care in "the States"—Germans, like Carl Schurz, have played not an undistinguished part. There are several newspapers in their own language, but any other attempt to preserve a separate national feeling has been abandoned, as being neither practicable nor, if it were possible, anything but mischievous. Still there are whole districts in the city which might be in Dresden or Hamburg, and there naturally, from the number of compatriots gathered in one place, the manners of the Old World prevail. They have their dancing, singing, and gymnastic clubs; but when it was attempted to establish the "Germania," into which no American was to be admitted, the scheme utterly broke down. German influence, however, has put its impress on the public schools of the city, and on the more thoughtful class. In no city in America is Kant's

"Kritik of Pure Reason" better known, or Hegel more laboriously tried to be understood, as witness in the discussions of the "Philosophical Society" and in the "St. Louis Journal of Speculative Philosophy."

The sweltering heat of a Missouri July day, a day in which the stranger incontinently melts, has little influence on the keen St. Louis merchant. He clothes himself in the

COTTON SHOOT.

thinnest of linen, and the broadest-brimmed of straw hats, and then, armed with a fan, seats himself in his office, or plies his trade in the Exchange, determined that in cotton he shall bring his city ahead of Houston, Galveston, or New Orleans, and as a grain distributor "whip" Chicago and the lake cities. St. Louis is already the railroad centre of the Mississippi Valley, and is fast becoming the metropolis of the steamboat traffic of the mighty river which flows past its wharves. Low water and railroad competition have for some years past made the steamboat men draw long faces. Still, the day when the railways will absorb the traffic of the Mississippi Valley is far off, and the river yet remains

picturesque and vivacious, by dint of the quantity of all kinds of craft that grate their keels against the St. Louis levee—boats, barges, rafts, the floating palaces, the strong, flat-bottomed Red River packets, the cruisers of the Upper Mississippi and of the turbid Missouri, the coal, copper, lead, and iron-laden barges, the huge grain-laden arks, each capable of receiving 100,000 bushels of grain; while rafts of every size and shape are scattered along the giant stream, to use Mr. King's simile, "like chips and straws on a mountain brook." Nearly 3,000 steamboat arrivals are annually registered at the port of St. Louis. "Drifting down on the logs come a rude and hardy class of men, who chafe under city restraint, requiring now and then stern management. Sometimes one of these figures, suddenly arriving from the ancient forests on the river above, creates a sensation by striding through a fashionable street, his long hair falling about his wrinkled and weather-beaten face, and his trusty rifle slung at his shoulder." Steamboating on the Mississippi is a proverbially dangerous business. In 1882 there were over 500 disasters on the river and its tributaries, not many attended with loss of life, but all resulting in great loss of property. The record of these disasters is not without its grim humour. One can hardly suppress a smile at the announcement in the terse, expressive language of the river, that "*Phil. Sheridan* broke loose at St. Louis," or that "*Hyena* broke her engine," "*Lake Erie* ran through herself," "*Ind Hen* blew up at Bellevue," "*Enterprise* broke a wrist at Cairo," "*Andy Johnson* blew out a joint near Alton," "*Wild Cat* sunk a barge at Rising Sun," "*Humming Bird* smashed a shaft," "*St. Francis* broke her doctor," "*Daniel Boone* was crowded on shore by ice," or "*John Kilgour*, trying to land at Evansville, broke nine arms." The river men have not been satisfied to confer upon their beloved crafts the names of heroes and saints. "They rake up all fantastic cognomens which the romance of the century or the slang of the period can afford, bestowing them upon clumsy and beautiful crafts alike, while they pay but little regard to congruities of gender or class. The *Naiad* may be a coal barge, or *Dry Docks* a palace steamer." The cotton steamers have often to load at a plantation somewhat in the manner figured on p. 121.

Kansas City, built on the southern bank of the Missouri, just below the mouth of the Kansas, was, at one time, a station for the wild "bull whackers," or bullock-wagon drivers, who came there to load their "prairie schooners" from the Missouri river boats. At that period it was touchingly characterised by one of the frontier men, who gave it its unenviable notoriety, "There's no railroad west of Junction City, no law west of Kansas City, and no God west of Hays' City." Railways gave it life, as they gave life to a hundred other similar "cities." More than 50,000 people have now settled here. They have bridged the Missouri, and control the markets from the Missouri to the Rocky Mountains, have a valuation of 50,000,000 dollars, and a jobbing trade alone of 17,000,000 dollars or more. "Packing" pork and beef is one of the great trades of Kansas City. In 1872 more than 20,000 cattle and 120,000 swine passed through the hands of its butchers. In ten years Kansas City will become one of the great centres of the West. The influence and mark of Southern manners, Mr. King tells us, have vanished from the western sections of Missouri, just as has the hard drinking, hard riding, blustering, bowie-knife-wearing "border ruffian," to whom the old state of matters was so congenial. A new type has arisen,

and swept out of sight those who prevailed "befo' the waw." New England people are arriving, so that manners in such sections as are settled by the Northern people have a curious mixture of Colorado and Maine. In the wilder parts of the State ruffianism still prevails, though it finds it rather a difficult task to hold its own. The "Pike County" man, once a proverb and still a familiar name, has a healthy idea of rough, average justice, and of the necessity of keeping down future rascality. He never troubles a court of law with trying a horse thief. Such a miscreant always obtains short shrift and a long lariat. Missouri still requires many more people before it can attain the maximum of that prosperity of which it has the factors within it. The river bottoms are as rich as the Valley of the Nile. "In journeying beside them on the Missouri Pacific Railroad one sees immense spaces but recently cleared of forest, dotted with log cabins and barns, and their omnipresent appendages, the hog-yards, filled with dozens of swine; yellow cornfields, acres on acres, extending as far as the eye can reach among the gnarled trees; men and women cantering to market on bare-backed horses, and young children staring from the zigzag fences." The life is like the product of the soil, dirty and coarse, but it is full of vigour. Towns spring up in Missouri, as they do in all the West, as Mark Tapley remarked, "spontaneous like, owing to the fertility of the soil," and the spread of railways. The capital (Jefferson City) is a prosperous town of 6,000 inhabitants, and has been the seat of government since 1828, previous to which it was rather peripatetic. But it is a principle in America generally to have the capital near the centre of the country, and, if possible, never to submit it to the influences of a large metropolis, which are often for evil, and rarely for good. Though Missouri suffered grievously by the war, yet she withheld herself from the cause of Secession, and found her profit in so doing.

ARKANSAS

is, in length, 242 miles; in breadth, 170 to 229; in area, 52,850 square miles; and in 1880 its population was 802,525. In other words, the State is the size of England, and its population that of Nagpore. The surface is, in the eastern part, to a great extent, low and marshy, though the centre and west are hilly, or covered with undulating prairies; while, beyond the Ozark Mountains, it consists of an elevated plain stretching on towards the Rocky Mountains; and the climate is more salubrious than that in the low lands bordering on the Mississippi. The Washita, White River, Red River of the South, St. Francis, &c., drain it. The soil varies greatly, though in nearly every part cotton, maize, wheat, and oats grow well; while among the mineral products are iron, coal, zinc, lead, manganese, gypsum, and salt.*

Little Rock, the capital (population 13,200), originally a French settlement, is situated on the Arkansas River. The State was as early as 1671 a French colony; and during the period of John Law's Mississippi scheme, Louis XV. made a grant of land on the Arkansas to that well-known adventurer. In 1763 it was handed over to Spain, and again in 1800 returned to France. In 1803 it was purchased by the United States; in 1836 it was received into the Union as a slave State; and during the Civil War threw in its lot with the Confederacy. The Arkansas River, one source of which we have engraved

* Owen: "Report on the Geological Survey of the State" (1858 and 1860).

(p. 105), rises in the Colorado Rocky Mountains, at an elevation of 10,000 feet above the sea, and after describing a course of 2,170 miles, and draining an area of 178,000 square miles, falls into the Mississippi at Napoleon. It is navigable by steamboats of slight draught to forty miles above Little Rock, and during high water to Fort Gibson, 150 miles higher up. Napoleon, it may be remarked in passing, was once a flourishing town, but has now almost slipped into the stream. It did not bear a good reputation in past days. Illustration—

"THE TOWER ROCK," ROCK ISLAND, ON THE UPPER MISSISSIPPI.

tive of the manners and customs of the Napoleonites, various grim anecdotes are related. It was here that a man showed a casual passer-by on a steamboat a pocket full of ears, with the explanatory remark, that "he had bin among the boys last night, when they were having a frolic." Brawls were frequent; and brawls at Napoleon—as is the custom of "Arkansaw"—"always ended in burials." In those days an Arkansas neek-blister was a familiar name for a bowie-knife, from the fact that the desperado of these parts usually concealed his "wepen" down his back, when he did not carry it inside his knee-boot. It is a common phrase to say that "Arkansas is all swamp and backwoods," but this is erroneous. Many tracts along the Mississippi are unmitigated swamps, but the lands

which extend from Napoleon to Memphis (on the Arkansas side) are fine, rich lowlands, which may in time be drained, settled, and if carefully cultivated, become a home where the negro may grow prosperous.* Out of seventy-four counties, fifty-one are watered by navigable streams. "The climate varies with the location, but none could be healthier than that of the romantic mountain region, more invigorating than that of the thick

pine forests in the lower counties, or more malarial than are the undrained and uncleared bottom lands." For long Arkansas was unpermeated by railways; while the evil reputation, more or less exaggerated, of the citizens, kept out of the country quiet-loving travellers who had no desire to eat at table with a revolver alongside their plates, or to whom the pistol-shots, heard almost daily along the banks of the river, were not musical sounds. Hence the settlers who were rough remained so, while the quiet people, of whom there were always numbers in the territory, were in a hopeless minority. Matters are,

* Henry: "Resources of Arkansas."

however, greatly altering for the better, and Little Rock, since "the iron horse snorted in its streets," has wonderfully changed. It is now a pretty, well laid-out town, and many of the streets are beautifully shaded with azaleas, japonicas, China, and peach trees, the lovely magnolias, box elders, and elms affording a striking contrast to some of the rude lowland towns near the river, or the "log-built unkempt settlements in the interior, where morals are bad, manners worse, and there are no comforts or graces." Still, in the more remote parts of the State, society is very rude and very bad. Whisky and the universal habit of carrying arms are the chief causes of this, while the slight regard for human life which prevails throughout the country operates badly against the preservation of order, which has not yet recovered from the shock of the Civil War.

Perhaps, on the whole, the "coloured" people of Arkansas exhibit the most cheering prospects. Many of them are men of education and refinement, and having obtained a prominent place in the Government, exhibit more fitness for it than the liberated slaves have usually done in the reconstructed States. The whites are, to a great extent, ambitionless, and even the most enthusiastic seem dubious about the future prospects of the country since the "surrender," as they style that final scene in the drama of the Confederacy, enacted at Appomattox Court House. Yet the resources of the State are immense. It contains nearly 12,000 square miles of coal, while the lead belt extends diagonally across the State, and the lead and silver mines promise well. Kaolin (China clay), gypsum, copper, and zinc are found in profusion; manganese, ochre, and earth-paints exist in many places, while there are great quarries of slate, whetstone, limestone, and marble. Finally, iron has been discovered at various points, and, combined with the stores of coal, ought to enrich the State. The forests of yellow pine, cypress, cedar (juniper), cottonwood, mulberry, oak, hickory, and pecan (*Carya oliviformis*) are also valuable, while there are still 8,000,000 acres of State lands ready for settlers to occupy. All that is required is a decently good government and some education, both of which "Rackensack" is likely to get under the constitution adopted in 1874, and still in force.

THE INDIAN TERRITORY.

The "Indian Territory" is neither a Territory nor a State. It is simply a something devised to avoid a difficulty. From time to time the aborigines who once inhabited the country east of the Mississippi, and some of those also living west of that river, have been removed thither, and little by little the Government is encroaching on the domain assured to them, as so many other domains have been ensured from time to time, and as often, to the disgrace of the Government, filched. Its area is 52,780,000 acres, and the population scarcely enough to make a town of moderate size. The number of Indians scattered over its vast plains and among its mountains has been estimated as follows:—Cherokees, 23,336; Choctaws, 16,000; Creeks, 15,000; Chickasaws, 6,000; Seminoles, 2,700; Osages, 3,435; Sacs, Foxes, Kickapoos, Shawnees, and others, 2,227; Cheyennes (p. 128) and Arapahoes, 6,569; Kiowas, Comanches, Apaches, Delawares, and others, 4,214; Pawnees, Quāwpaws, Poncas, and smaller tribes, over 4,000—in all about 79,000, who inhabit a Territory, the great distances in which are only partially unbridged by railways, and are so separated from each other by barriers

of language and custom, that there is hardly any intercourse among them. "The land lies waste because there are not hands to hold the plough, and the country remains a desert because the Indian jealousy refuses to allow the white man to make it blossom like a rose;" and the Indians are quite justified in so doing. Blossoming like a rose may be a very pretty natural operation to look at, but it may be a sight purchased too dear when it is performed at the expense of the Indian for the sake of the white man, to whom he is indebted for nothing but much wrong. No white man is allowed to settle here, unless by permission of the Indians, and even then leave is never given unless the applicant be of fair character, has married a dusky bride, and is willing to relinquish his allegiance to Uncle Sam. The Indian holds firmly by the treaty of 1837, by which he was to be allowed to live undisturbed here so long as he settled in it. Previous to that date most of the country belonged to the Osages, who have now diminished to a few thousands. Yet before the tribes could be transported to it the country was deluged with blood. From the unwillingness of the Seminoles to remove from their fair land originated the Florida War, and time after time smaller difficulties have arisen. The Indians in the territory receive annuities, derived from the sale of lands in other parts. These amount to about \$95,000 dollars *per annum*. A railway spans their territory, but the Indians keep away from it, and travellers by it rarely see one of the aborigines. The Cherokees have made the greatest advance in civilisation, and have a ruling voice in all that concerns the polity and resources of the aborigines. Their general status, we are assured by one of the latest visitors to them, is not below that of the white backwoodsman. They are good agriculturists, though living remote on farms which they hold in common, yet to which each individual has a perpetual right of occupancy. All the Cherokee land is vested in the nation. "A man may sell his improvements and buildings, but not his land." Yet the Indian will never be a farmer in the true sense of the term. He has no idea of making gain; he only desires to "make a living." Throughout the various nations settled in the Indian territory there is an utter neglect of internal improvements. "An Indian highway is as difficult as the Vesuvian ascent, and none of the magnificent rivers were bridged before the advent of the Missouri, Kansas, and Texas Railway." The Indian agent, who serves the double purpose of being Indian trustee and diplomatic agent from the Government of Washington, or, to give a closer simile, bears to the chiefs of the tribes much the same relation as the Residents at the native courts of Hindostan do to the Princes to whom they are accredited, has, however, here and there, suggested a few improvements, which have been followed up. The government of the Cherokees I have sketched in another work.* It is, to a great extent, modelled on that of the American State governments. The chiefs—a "principal" and a second chief—are elected every four years. They have an upper and a lower house of legislature, the former continuing in power four, and the latter two years. There is a supreme court, with three judges, and the usual staff of district judges and sheriffs. Tahlequah is the capital. It looks like an ordinary South-West town, with nothing particularly Indian about it. The Choctaws and Creeks have the same general form of government, while the Seminoles have vested their executive authority in twenty-four band-chiefs, all controlled by a "principal," an absolute

* "Peoples of the World," Vol. I., p. 206.

autocrat, with an irrefragable veto; however, all the tribes join in a general council, presided over by the Superintendent of Indian Affairs for the Southern Superintendency; but at this meeting only the rendition of criminals, the joint action in regard to land, and

CHEYENNE INDIAN CHIEF.

similar matters, which are of comity between the nations, are legislated upon. When the Civil War broke out, the greater number of the Indians sided with the Confederates. Hitherto they had known next to nothing of the Northern people, or of Northern politics, while, on the other hand, most of these were slave-owners, some of the Cherokees owning from 200 to 300 slaves, and negroes who had settled among the Indians also held slaves.
